THE ROLE AND REMIT OF THE FINANCIAL MARKETS LAW COMMITTEE

The role of the Financial Markets Law Committee (the "FMLC" or the "Committee") is to identify issues of legal uncertainty or misunderstanding, present and future, in the framework of the wholesale financial markets, which might give rise to material risks, and to consider how such issues should be addressed.

The following is a selection of publications by the FMLC on issues of legal uncertainty arising in the context of Financial Technology.

The FMLC wishes to thank the individuals credited in the subsequent pages for their assistance in the preparation of the publications included herein. Note that members of FMLC Working Groups act in a purely personal capacity. The names of the institutions that they ordinarily represent are given for information purposes only.

PREFACE

PREFACE: ISSUES OF LEGAL COMPLEXITY IN FINTECH

The role of the Financial Markets Law Committee (the “**FMLC**” or the “**Committee**”) is to identify issues of legal uncertainty or misunderstanding, present and future, in the framework of the wholesale financial markets, which might give rise to material risks and to consider how such issues should be addressed.

In 2014, stakeholders recommended that the FMLC explore legal uncertainties arising from the proliferation of digital currencies such as Bitcoin. In response, the FMLC established the Virtual Currency Scoping Forum as a space for discussion and initiated an analysis of the legal character of virtual currencies and their development as a medium of exchange. The results of that analysis—and that of a broader evaluation of Financial Technology (“**FinTech**”) by the Committee—are collected chronologically in this volume.

In 2016 the Committee published a paper examining how established cryptocurrencies may fit into the traditional categories of property and personal rights established at Common Law. In the paper—reproduced in section 1 of this volume—the Committee expresses the view that the virtual currencies which have achieved status as a medium of exchange within a significant user community have a good claim to be regarded as money.

Following publication of the paper, two court decisions in the U.S. took conflicting views on the question whether Bitcoin is to be regarded as money. These decisions are summarised in an addendum to the paper, reproduced in section 2 of this volume.

The Committee has observed that a wider array of technological innovations affects the financial markets than the introduction of virtual currencies. As the pace of innovation poses challenges for regulators, the Committee decided in 2016 to widen the remit of the Virtual Currency Scoping Forum to include discussions on developments in regulatory technology and cybersecurity. On the recommendation of the new Finance and Technology Forum, in March 2018 the Committee published a paper examining issues of legal uncertainty relating to Distributed Ledger Technology (“**DLT**”) and the pressing need for international consensus on the manner of determining the law governing transactions on a DLT system. This need is particularly acute in the case of assets that have no existence independent of the DLT system (the greater part of which can be covered by the soubriquet “**virtual tokens**”).

In the paper, which is reproduced in the third and final section of this volume, the Committee examines the issues and impact of legal uncertainty in identifying the law applicable to proprietary effects of DLT transactions, considers possible frameworks for mitigation and ultimately sets out the FMLC’s proposed solution, concluding that—subject to a special rule in respect of tokens referencing an immovable asset—elective *situs* (i.e., a system of law chosen by the network participants for the DLT system) should be the starting point for any analysis of a conflicts of law approach to virtual tokens.

The expanded Finance and Technology Scoping Forum continues to identify and assess legal uncertainties in relation to this complex, fast-growing sector. Recently, the Committee has established a Working Group to examine the legal characterisation of initial coin offerings and whether such a form of crowdfunding might constitute a regulated activity. It is also currently considering work on emerging technologies such as smart contracts and virtual securities.

FINANCIAL MARKETS LAW COMMITTEE¹

This paper has been prepared by the FMLC Secretariat.²

¹ The names of FMLC Members are given at the back of this paper. Given the involvement of HM Government and the regulatory authorities in the subject matter, Stephen Parker, Sonya Branch and Sean Martin took no part in the preparation and discussion of this paper.

² Joanna Perkins (FMLC Chief Executive); Paul Mortby (FMLC Project Assistant) and Ion Soltoian (FMLC Issues Assistant). The FMLC Secretariat is most grateful to Charles Kerrigan (Olswang LLP) and Antony Zacaroli QC (South Square Chambers) for their contributions and to Adam Sanitt (Norton Rose Fulbright LLP) for his comments.

The FMLC is also grateful to the members of the Virtual Currencies Working Group, chaired by Antony Zacaroli QC (South Square Chambers), for the discussions which precipitated this analysis. The remaining members are Raymond Cox QC (Fountain Court Chambers), Alison Debattista (Barclays), Andrew Harvey (Association for Financial Markets in Europe), Charles Kerrigan (Olswang LLP), Nina Moffatt (Baker & McKenzie LLP), Julie Patient (Hogan Lovells International LLP), Marina Paul (Lloyds Banking), Carmen Reynolds (White & Case LLP), Sam Robinson (Nabarro LLP), Adam Sanitt (Norton Rose Fulbright LLP), Mark Silverstein (Citi) and Islam Zaglul (Financial Conduct Authority).

1. PREFACE

The role of the Financial Markets Law Committee (the “FMLC” or the “Committee”) is to identify issues of legal uncertainty or misunderstanding, present and future, in the framework of the wholesale financial markets which might give rise to material risks and to consider how such issues should be addressed.

In 2014, stakeholders approached the FMLC with a recommendation that exploratory work be undertaken by the Committee on the topic of virtual currencies. In response, the FMLC established a “Virtual Currency Scoping Forum” as a space for discussion, with particular reference to the robustness of the existing legal architecture and its ability to accommodate the rapid financial and technological innovation which virtual currencies represent.

This paper analyses the legal aspect of virtual currencies and addresses issues of uncertainty in the context of their development as a medium of exchange. In the course of so doing, some of the advantages and disadvantages described above are examined in greater detail.

The Committee may publish further similar studies in due course.

2. A BRIEF INTRODUCTION TO VIRTUAL CURRENCIES

Virtual currency schemes—also known as digital currency schemes—have proliferated in recent years. As their popularity with consumers and businesses has increased, regulators and markets have been compelled to pay greater attention to them. Proponents argue that they provide the benefits of anonymity, speed and convenience, and remove the need for a payment intermediary. Opponents, on the other hand, claim that anonymity facilitates crime, including money laundering;³ that virtual currencies depend, almost entirely, on information technology networks which may themselves be subject to systemic risk; that “cryptocurrencies” are volatile; and—despite cryptographers efforts to address many of the risks that can erode financial value—that they are particularly susceptible to loss or theft.

³ In the U.K., HM Government has resolved to address this issue: HM Treasury, “Digital currency: response to the call for information”, March 2015, available at: https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/414040/digital_currencies_response_to_call_for_information_final_changes.pdf. See p.19.

The truth is that a wide variety of currencies exist and that, as a group, they share few, if any, common characteristics. Some virtual currencies can be held and used only in the context of a computer game, while others are a straightforward electronic reflection of a “real world currency”, like U.S. dollars. The regulatory and legal concerns to which these schemes give rise will bear almost no relation to concerns which regulatory authorities have expressed from time to time about more complex schemes. The paragraphs below provide a brief overview of some of the most well-known virtual currency schemes.

Bitcoins, the best-known and the most prevalent units of virtual currency, are created by a technological process referred to as “mining” which is simulated by an individual’s contribution to the computing power of the virtual network serving the scheme. A finite number of Bitcoins can be “mined” by this process, a limitation which is expected ultimately to determine the market value of Bitcoins. The scheme is supported by “distributed ledger technology” (or “DLT”) which creates a decentralised transactional system.

Another name for DLT is “blockchain”. That is because the technology operates to create a chain of blocks (or files) containing transaction data in which each new block contains a derived form (i.e., a hash) of the previous block. These blocks are stitched together in a chain of increasing length, the authenticity of which is verified by the combined computing power of multiple users on the network. The chain is extended when new transactions are organised into new blocks which are then added to the end of the existing blockchain and resubmitted to the network. Once accepted by the distributed network, a block cannot be changed or removed. A block which is created but rejected by the network becomes orphaned and cannot be reintegrated into the system. This is designed to prevent transactions being duplicated and to eliminate the re-use (or “double spend”) of coins or tokens—risks to the robustness of virtual currency schemes which will be discussed more fully below. A full copy of a currency's blockchain would contain every transaction ever executed in the currency.

Bitcoin and other similar “altcoins”, such as Litecoin, are properly described as “cryptocurrencies” because they rely on cryptographic techniques to record transactions in the decentralised ledger and to identify the unique character of individual coins. One cryptocurrency platform which has gained a higher profile recently is Ethereum, where transactions are executed in an altcoin called Ether.

Unlike, say, the Bitcoin platform, Ethereum offers programmable, automated transaction functionality (or “smart contracts”). In June 2016, a crowd-funded investment vehicle consisting of a “decentralised autonomous organisation” (or “DAO”)—which may be thought of as a collective virtual wallet enhanced by “smart” contracts governing membership, voting and investment management—was attacked and Ether worth some \$55 million was withdrawn without investors’ permission.

Both Bitcoin and Ether are “mined” using network power. One cryptocurrency which is not mined in this way is Nemcoin, also known as XEM, which is transacted on the NEM platform. Newly “minted” Nemcoins were first distributed evenly to about 3000 stakeholders in the community. Having been distributed, the coins can now be transferred on the NEM platform, which incorporates DLT like other altcoins. New blocks in the blockchain are created by an author who is identified using a consensus technique called “Proof-of-Importance”. This mechanism is intended to encourage stakeholders to spend, rather than hoard, the coins.

In contrast to these cryptocurrencies, Ripple—the second largest virtual currency scheme by market capitalisation—is a centralised payment system built around a shared public database.⁴ This central ledger can only be amended by a process known as “consensus”—a democratised technological voting mechanism which does not depend on cryptographic techniques to record transactions. Unlike Bitcoin, Ripple allows for the direct exchange of other currencies, including “real world” currencies, through its payment system.

Where a virtual currency has this characteristic of being interchangeable with “real world” currency, it is sometimes said to be “open” rather than “closed”. If the currency is freely interchangeable it is said to have “bidirectional flow”, if it can be purchased but not sold in other currencies it is said to have “unidirectional flow”. An example of the former is Linden Dollars, the currency created for the purposes of the online virtual world known as Second Life. Linden Dollars can be bought for U.S. dollars with a credit card and exchanged for digital goods inside Second Life. Surplus Linden Dollars can then be sold and converted back into U.S. dollars. Examples of the latter are to be found among the schemes created by the purveyors of computer games for use within their games, e.g. “Nintendo Points”, which can be

⁴ Ripple, available at <https://ripple.com/>. See also Ripple, “How Ripple Works”, available at https://ripple.com/knowledge_center/how-ripple-works/.

purchased online by credit card but which cannot subsequently be converted back into money in the real world. Some virtual currencies are not “open” at all. Among these are “in-game” currencies which cannot be bought or sold outside the game. World of Warcraft Gold is said to be an example.

Bitcoin is a scheme which is technologically “closed” but is functionally “open”. That is, there is no exchange possible between Bitcoins and real world currencies within the scheme itself—balances cannot be held and transactions cannot be executed or recorded in other currencies. Nonetheless Bitcoins have been designed as a “real world” medium of exchange and the market that has grown up around the scheme allows holders to purchase articles of commerce in the usual way from enterprises that accept Bitcoins as payment. Although new Bitcoins can only be created and introduced into the system by the activity of “mining”, as described above, platforms have been established which allow users to buy and sell Bitcoins for “real world” currency.

Notwithstanding the possibility of currency exchange, Bitcoins are not pegged to any real world currency. The exchange rate is determined by supply and demand. Money supply depends upon limits baked into the scheme as mentioned above and on a projected reduction in Bitcoin production which will occur as the scheme loses velocity. (The algorithms which produce new coins will become more complicated, exhausting the available network computing power, leading to the production of fewer Bitcoins). Some virtual currencies, however, are pegged, to a greater or lesser extent, to real world currencies. The Linden Dollars scheme, for example, is managed by Linden Lab which has made a deliberate decision to maintain a stable exchange rate with the U.S. dollar and achieves this by “printing” Linden Dollars as necessary. Where a virtual currency has perfect “peg” to a real world currency, as online vouchers do, for instance, it will likely be classified as “e-money” for the purposes of legislation (discussed further below) and may be said to have “crossed over” into the real world as an electronic representation, like bank balances, of real money.

It will readily be seen from this cursory scan of the virtual currency environment that a wide range of schemes have been initiated and that many of these have little in common with one another. Various efforts to define the class as a whole have been made by experts, authorities and commentators and some of these are set out (for interest only) in an annex to this paper. The analysis below is primarily intended to

address the legal aspect of virtual currencies whose value floats against real world currencies but which remain either technologically or functionally open to real world currencies.

3. PROPERTY OR PERSONAL RIGHT

At the heart of many of the regulatory questions which surround virtual currencies is the question of their legal character. At the heart of that question is another: how to allocate this new and, allegedly, disruptive technology to the traditional categories of property and personal rights developed by the common law.

The characteristics of property are well-established and were summarised in *National Provincial Bank v Ainsworth* [1965] 1 AC 1175 at 1247-8, by Lord Wilberforce:

before a right or an interest can be admitted into the category of property, or of a right affecting property, it must be definable, identifiable by third parties, capable in its nature of assumption by third parties and have some degree of permanence or stability.

Examples of rights and interests which do not qualify as property within this broad definition include licences, certain quotas, permissions, reversionary interests, a claim for rescission and a right to apply for a discretionary court order. These are rights or interests which confer a benefit, if at all, exclusively on the person of the right-holder and they cannot be transferred.

Recent judicial decisions have tended to support the categorisation of rights as property wherever they have acquired economic value and shown themselves susceptible to transfer and trade, even in cases where the intention of the originator is to implement a purely administrative scheme. For instance, a milk quota and an emissions allowance have both, notwithstanding each is commonly understood as a licence or permission, been held to be property.⁵ With this in mind, the likelihood is that those units of virtual currency which have been convincingly shown to have both economic value and transferability among market participants will be categorised as a type of property at common law. Whether a particular virtual

⁵ See, for example, *Swift v Dairywise Farms Ltd* [2000] 1 WLR 177 (milk quotas) and *Armstrong DLW GmbH v Winnington Networks Ltd* [2013] Ch 156 (emissions allowances).

currency is sufficiently robust to have economic value and transferability in market terms is a threshold question which is beyond the scope of this paper.

4. IN ACTION OR IN POSSESSION?

Property in English law may be either real or personal property. According to *Halsbury's Laws of England* (4th edn) Vol 35 para 1201, personal property is "[broadly] all forms of property, movable or immovable, corporeal or incorporeal, other than freehold estates and interests in land". It follows that, if units of virtual currency are property, they are personal property.

Personal property is further divided into chattels real—largely leasehold interests, which may be disregarded for the purposes of this paper—and chattels personal, where the latter can be either "in possession" or "in action" at common law, hence: "choses in possession" and "choses in action". A chose in action is a property right that can only be obtained or enforced through legal action. A chose in possession, in contrast, is a thing of which physical possession can be taken.

In other jurisdictions, as well as in some U.K. statutes,⁶ it is more common to divide personal property into tangible and intangible property. Where this distinction is made, it is logical to assume that units of virtual currency—being "virtual"—must be intangible property, if they are property at all. In this, virtual currencies would differ from, say, sovereign currency in the form of coins and notes. (These latter are tangible property and so chattels in possession—although notes may be simultaneously a chose in action, which is a kind of intangible property.⁷) This is the view which has been taken, for example, by the New York Department of Taxation and Finance in saying that, for sales tax purposes, convertible virtual currency is intangible property.⁸

The class of intangible property is normally regarded as essentially the same as the class of choses in action. Nonetheless, virtual currencies may share several of the characteristics of choses in possession, described in *Halsbury's Laws of England* (2013) Vol. 80 para. 806 as:

⁶ For example, the Finance Act 2004; the Fraud Act 2006; and the Theft Act 1968.

⁷ Proctor, *Mann on the Legal Aspect of Money*, 7th Edn. (Oxford, 2012), see paragraph 1.46.

⁸ Technical Memorandum TSB-M-14(5)C, (7)I, (17)S of December 5, 2014.

things which are at once tangible, movable and visible, and of which possession can be taken, for example animals, household articles, money... and everything else that can properly be put in motion and transferred from place to place.

Taking Bitcoins as an example, it is noteworthy that they are transferred and stored in such a way that they may be lost, which the common law recognises as a characteristic of choses in possession but not of choses in action.⁹ A related point is that a transfer of possession can be effected by placing Bitcoins in a digital wallet on the user's computer, which will connote a transfer of ownership. Here, the Bitcoin is not merely representative of property rights (as most retail storage or delivery receipts would be, for example) but appears to be—at least, within the logic of the virtual system—a right in possession.

A great many consequential legal issues and questions would naturally flow from the legal classification of virtual currencies as either choses in action or choses in possession. On the one hand, were a virtual currency to be classed as a form of chose in action, then the question automatically arises against whom the action to enforce the rights of owner lies. This is likely to be critical for a trustee in bankruptcy or a liquidator appointed in the event of the insolvency of the holder of virtual currency. The office-holder would need to know against whom action could be taken to realise the value in the virtual currency. It is similarly important for anyone considering taking security over virtual currency.

It is impossible to do more in this paper than highlight this as an area of legal uncertainty since identifying the person or persons who have control of the virtual coins or tokens and against whom it is therefore appropriate to act to enforce the holder's rights is likely to vary depending on the type or nature of the virtual currency. The answer is likely to be different as between, on the one hand, a virtual currency such as Bitcoin, with a distributed ledger (where it is difficult to identify any person against whom action could be taken to vindicate rights constituted by the virtual currency) and, on the other hand, those available within the confines of a computer game (where there may, for example, be a contractual right against the creator of the game).

⁹ A chose in action cannot be the subject of an action in conversion: *OBG Limited and others (Appellants) v. Allan and others* [2007] UKHL 21 where an action for conversion is historically rooted in a fictitious allegation that the claimant has lost the chattel and that the defendant has found it; *OBG* at [95]. (A chose in action can, however, be the subject of a theft.)

If, in contrast, virtual coins or tokens are choses in possession, and their value is realisable solely by virtue of their being exchanged for something else, then it is vital for a trustee in bankruptcy, liquidator or secured creditor to know by what means, if any, s/he is able to obtain possession of the coins or tokens. In particular, an insolvency practitioner will wish to understand how to transfer coins or tokens to a third party so as to exchange them, directly or indirectly, for “real world” currency that can be made available for distribution to creditors.

On balance and considering the issues sketched very briefly above, it would seem that the legal uncertainty arising if virtual currencies are classified as choses in action is likely to be greater than if they are acknowledged to share the essential characteristics of choses in possession. Given that some virtual coins and tokens, at least, share certain characteristics of both intangible property and choses in possession, however, it may be convenient to understand them—where the currency is economically robust enough to be classed as “property”—as a kind of hybrid: “virtual choses in possession”. That is, intangible property with the essential characteristics of choses in possession.

One question which might arise for re-evaluation in light of this suggestion is the question whether virtual currencies constitute “goods” for the purposes of sale of goods legislation. In England, a sale of, say, Bitcoins could not qualify as a sale of goods, even if they were a personal chattel, if they were classified either as a chose in action or as money. In Scotland, the same sale would not qualify if Bitcoins were classified as “incorporeal property”. There is a risk, however, that anything deemed to be a “virtual chose in possession”—intangible/incorporeal and yet somehow capable of being held “in possession”, without (at least, in the case of virtual currencies) qualifying as money—would naturally fall to be classified as “goods” in England but not in Scotland. This would be an odd outcome.¹⁰ The FMLC notes that this question is primarily one of consumer policy, rather than legal classification, and may be dealt with accordingly by statutory amendment. The question whether virtual currencies may be classified as “money” (which would avoid any divergence between the scope of application of the statute in England and its application in Scotland) is discussed below.

¹⁰ Interestingly, in other common law jurisdictions, choses in action and forms of intangible property can sometimes qualify as goods for the purposes of sale of goods legislation. See, for example, in New Zealand, the Fair Trading Act 1986, section 2 where “goods” means “personal property of every kind (whether tangible or intangible)”.

5. DOCUMENTARY INTANGIBLES

One traditional category of property which shares some of the characteristics of both choses in possession and choses in action is constituted by what are sometimes described as "documentary intangibles".¹¹ An example of this kind of hybrid property is a promissory note. Here, the debt itself is a chose in action, but the document which represents it is a chose in possession. The two cannot be separated and when the document is transferred so, too, is the debt, as a general rule. Professor Bridge describes a right in this category as one "so firmly 'locked up' in the document embodying it that it can be dealt with at common law only through the medium of that document" and he goes on to give bills of lading and bills of exchange as good examples.¹²

Property of this kind includes negotiable instruments (bills of exchange, promissory notes and cheques); negotiable securities (for example, bearer bonds and notes) and certain other mercantile documents relating to the storage, transport and delivery of goods (for example, bills of lading). When such instruments are transferred, the purchaser who takes them in good faith, for value and without notice of the defect in title, acquires a good title even though the seller may have had a bad or defective title or, indeed, no title at all.

Documentary intangibles which can deliver ownership with the transfer, or transfer and endorsement, of the document in this way are said to have the character of being "negotiable" and this will be discussed further below. Documentary intangibles represent a debt which can be sued upon like a chose in action but the document can also be the subject of an action in conversion—to recover their face value—like a chose in possession. The character of negotiability privileges documentary intangibles over and above ordinary choses in possession in that it permits the holder for the time being to transfer a better title to the property than he himself has.

Documentary intangibles are not the only kind of things which amount to more than a merely personal right but which sit uneasily between the traditional categories of chose in action and chose in possession. Goodwill, for example, is both intangible and recognised as a species of property but it is intransmissible other than as part of a

¹¹ See McKendrick (ed.), *Goode on Commercial Law*, 4th Edn (London, 2010), p.32; and Bridge, *Personal Property Law*, 3rd Edn (Oxford, 2002), p.6.

¹² *Ibid*, Bridge, p.230.

business and it may, in certain circumstances, be “locked in” to particular business premises like a corporeal chattel.¹³ Electricity is similarly resistant to easy definition. A person cannot steal electricity at common law, which suggests it is neither a chose in possession nor a chose in action, but the Theft Act recognises that it is nonetheless a thing of substance which is capable of “abstraction”.¹⁴ At the 2006 XVIIth International Congress of Comparative Law, hosted by the Netherlands Comparative Law Association, participants were invited to submit national responses to a questionnaire on areas where the status of legal rights or interests as incorporeal property might be in doubt and/or subject to national differences in approach, including: privacy rights (i.e. to one’s own image or personal data); intellectual property and credit. In her response, Dr Jane Ball observed, *inter alia*, that the extension of English property law rights to cover computer software had been limited.¹⁵ The particular case of computer software is discussed in the second annex below.

Returning to the subject of this paper, if there is general property in virtual currencies, the question remains whether they constitute choses in possession, choses in action, hybrid property which is negotiable and thus privileged in terms of possession, hybrid property which is non-negotiable, or something else entirely. The question of negotiability is discussed in the section below.

6. POSSESSION, DELIVERY AND OWNERSHIP

A basic principle of common law is the rule *nemo dat quod non habet*—that no one can give a better title than they themselves have and, conversely, a purchaser cannot receive better title to property than the seller. The principle is, however, subject to a number of significant exceptions, the commonest of which is probably money itself. Sovereign currency in the form of notes and coins in general circulation generally cannot be recovered from a person who has obtained possession of them in good faith—ownership of such notes and coins passes on delivery. In this respect, coins

¹³ See *Halsbury’s Laws of England* (2016), Vol. 77, para. 172.

¹⁴ *Law v Blease* [1975] Crim LR 513 established that a person using the electricity necessary for a telephone call was not guilty of theft; cf section 13, Theft Act 1968.

¹⁵ Ball, “The Boundaries of Property Rights in English Law”, *EJCL* available at: <http://www.ejcl.org/103/art103-1.pdf>, see para. 3.3.

and notes are sometimes said to be “negotiable chattels”, on account of the fact that title passes “in currency”, where negotiability refers to the idea that property or ownership can follow possession, if possession is taken in good faith for value. (Historic or commemorative coins which are not legal tender are not normally money but ordinary chattels and do not benefit from this exception.)¹⁶

Banknotes are a two-fold exception to the *nemo dat* principle because they also qualify as promissory notes (“*I promise to pay the bearer...*”) for the purposes of the Bills of Exchange Act 1882 and, thus, as negotiable instruments.

While the category of negotiable instruments may not be closed,¹⁷ this analogy would seem to be of limited assistance in an attempt to understand the legal nature of virtual currencies. First, there is the obvious objection that shoe-horning a modern payment technology like virtual currencies into concepts defined by Victorian legislation (i.e. the Bills of Exchange Act 1882) would seem to be retrogressive and, without amendment, precluded by the legislation itself. Second, there are a number of defining features shared by all negotiable instruments which are not, or not necessarily, replicated in virtual currencies. For example, negotiable instruments enjoy a hybrid character which in part reflects their nature as debts payable in a real-world currency. Units of virtual currency do not have this character and may not be pegged to any real world currency. Further, negotiable instruments are, by virtue of section 83 of the 1882 Act, to be executed in writing and signed by the obligor. Not only are the concepts of writing and signature not applicable to virtual currencies but units may be wholly anonymised. For these reasons, virtual currencies should not be understood as negotiable instruments, even by distant analogy with other financial innovations, such as vouchers and in-game “bank notes”, which more closely resemble documentary intangibles.

The category of negotiable things also includes negotiable or bearer securities.¹⁸ Here, however, it seems there is, if anything, less opportunity to push back the

¹⁶ For a detailed discussion see Proctor, *supra* n.6, at paragraph 1.73.

¹⁷ In the tax case of *Argos Distributors Ltd v Customs and Excise Commissioners* (Case C-288/94), the Advocate-General observed that a face value sales voucher “behaves as if it were a negotiable instrument”.

¹⁸ Bearer securities may transfer title with possession, although registered securities do not. Very few investors, however, hold negotiable securities such as bearer bonds, notes, warrants or shares today. It is much more common for an issuer to deposit a single Global Bearer Bond or Note at a central securities depository (or “CSD”) which will then record the interests of investors as book entries in an electronic system. By this process, investors acquire a dematerialised, intermediated interest in the bearer security. This “book entry” confers not a legal interest but an equitable one.

boundaries of the definition. The FMLC has, in the past, written extensively on the effects of dematerialisation and intermediation in securities systems, noting that these developments have left most end-investors with a merely equitable interest in securities, and has observed that:

it is highly unlikely that [mercantile] rules [which protect the good faith purchaser of negotiable securities] extend to electronic assets such as contemporary intermediated securities. As a result, a purchaser of the interest in, say, bonds (unlike a purchaser of a physical bond) is not protected by the rule that a holder in due course of a negotiable instrument takes free of any prior claims and is unaffected by any flaw in the title (for example, where the bond was stolen) of the transferor. Equity protects a person who in good faith acquires legal title without notice of any adverse claims, but this protection cannot apply if the purchaser only acquires an equitable interest in the securities.¹⁹

It would appear, therefore, that the categories of negotiable instrument and negotiable security are—to all broad intents and purposes—closed as far as technical innovation is concerned and unlikely to be extended, even incrementally, to new assets. If this is indeed correct, it means that the *nemo dat* rule will apply to virtual currencies—if they are chattels at all—unless they are negotiable chattels like money. This possibility is discussed in the following paragraphs.

7. MONEY, MONEY, MONEY

There is no single wholly satisfactory theory of what money is, particularly as to its legal aspect. Certain theories of money emphasise its function as sovereign currency and legal tender while others emphasise its societal role as a means of payment and yet others point to its economic aspect and its sensitivity to monetary policy.

While it is unlikely that any one of these theories can satisfactorily account for all the attributes of money, it is clear that one or other may be more or less useful for certain purposes. The “State” theory of money as sovereign currency has been important,

¹⁹ See: Financial Markets Law Committee, “Analysis of the need for and nature of legislation relating to property interests in indirectly held investments securities, with a statement of principles for an investment securities statute”, July 2004, pg 13, available at <http://www.fmlc.org/uploads/2/6/5/8/26584807/3b.pdf>.

for example, in helping us to answer both simple questions about counterfeiting and difficult questions about monetary union and economies in transition. But a theory of this kind will not easily account for the way in which U.S. dollars are more widely accepted in many economies—and, therefore, offer a better discharge of commercial obligations—than the local sovereign currency. Nor does it satisfactorily explain how consumers have come to regard a dematerialised chose in action, like a bank account balance, as “money in the bank”.

For questions like these, we need instead to have regard to money’s function as the currency of commerce. Charles Proctor, in *Mann on the Legal Aspect of Money*, refers to a theory of money which focuses on this function as “the Societary theory of money”.²⁰ According to this theory, the negotiability of coins and notes stems from their ability to “pass in currency”,²¹ i.e. commonly and continuously to be accepted as payment in exchange for articles of commerce. As explained by Best J in *Wookey v Pole* 4 B & Ald 1, the rule that “where the owner of money had lost the possession of it, he had lost the property in it” is justified because:

by the use of money the interchange of all other property is most readily accomplished. To fit it for its purpose the stamp denotes its value, and possession alone must decide to whom it belongs.

It seems reasonable to infer from this that if a chattel, having a face value or other ascertainable value, is widely accepted in “interchange” for all other kinds of property then the law will regard it as a negotiable chattel, whether or not it is also a unit of the sovereign currency. That is, a chattel which qualifies as money under the Societary definition should be negotiable whether or not it also qualifies under the State definition.

Whether units of a virtual currency have achieved the status of being “passed in currency” is a mixed question of fact and law. It is beyond the scope of this paper to analyse, or speculate on, whether individual virtual currencies might qualify or not. The FMLC notes, however, that the European Court of Justice—in a case which

²⁰ *Supra* n.6, see paragraph 1.29.

²¹ A phrase adopted by Lord Mansfield in *Miller v Race* (1758) 1 Burr 452, at 457.

called for an analysis, for tax purposes, of the nature of exchange transactions involving Bitcoins—stated that Bitcoins constitute a contractual means of payment.²²

8. E-MONEY: IT'S MONEY, JIM, BUT NOT AS WE KNOW IT...

In *Mann on the Legal Aspect of Money*, Charles Proctor considers the extent to which comparisons may be made between payments in physical cash and payments by bank account transfer.²³ He observes that a funds transfer has many of the hallmarks of a payment in cash: it will generally be irrevocable and will confer both “possession” of the funds and good title on the recipient, who need not—if he is himself in good faith—be concerned with the provenance of the funds (other, perhaps, than as a matter of financial regulation). Moreover, both the transferor and transferee will think of themselves as having dealt in “cash” or “money”—rather than in claims on the bank account provider(s)—and will also strongly think of themselves as *possessing* and *owning* that money when funds are credited, even though there may be, on a strictly traditional legal analysis, no choses in possession or negotiable chattels changing hands.

Proctor concludes that his analysis:

would appear to justify the earlier conclusion that funds standing to the credit of a bank account should be regarded as “money” for legal purposes.²⁴

In a later section of his book, Proctor extends the analysis to “e-money.”²⁵ E-money includes pre-paid cards (like oyster cards), pre-paid accounts online (as Paypal can be) and on electronic devices (such as mobile telephones). It is defined in European legislation as:

²² See case C-264/14, *Skatteverket. v. David Hedqvist*, available at <http://curia.europa.eu/juris/document/document.jsf?docid=170305&doclang=EN>.

²³ Proctor, *supra* n.6, at paragraph 1.75.

²⁴ *Ibid.*

²⁵ *Ibid.*, paragraphs 1.80 to 1.81. He observes that the recipient of an e-money payment need not have reference either to the identity or the creditworthiness of the payor and, like a bank transfer, the funds constitute money both owned and possessed by the recipient of the payment for all practical purposes.

monetary value represented by a claim on the issuer which is stored in an electronic device and accepted as a means of payment by undertakings other than the issuer.²⁶

Virtual currencies pegged to “real world” currencies may also be classified as e-money.

What is interesting about these passages is the implicit view that a functional definition of money is appropriate. The traditional categories of chattel distinguish, as discussed above, between tangible and intangible property, between choses in action and choses in possession. Money has traditionally been both tangible and “in possession”—the fact that negotiable instruments simultaneously represent a chose in action does nothing to change that—and a strictly traditional approach might suggest that it cannot exist outside those categories. Proctor, however, rejects this approach, in favour of a flexible, modern definition which better accords with the common understanding of money.

This account of money has implications for virtual currencies whether or not they are pegged to “real world” currencies and, therefore, like e-money, represent money’s worth. Once it is accepted that electronic money—i.e. money which is not constituted by tangible property and therefore cannot be the subject of physical control—can be possessed and that ownership can pass with possession, key objections that might otherwise exist to accepting virtual currencies, in their legal aspect, as “money” fall away. Another objection—that virtual currencies are not legal tender and not issued by the State—also falls away, since bank deposits and e-money are obligations issued by private organisations.

The cases of bank deposits and e-money, then, lend strong support to the view that virtual currencies which have become a medium of exchange and which are capable of “passing in currency” should, in their legal aspect, be viewed as money.

²⁶ Directive 2009/110/EC of the European Parliament and Council on the taking up, pursuit and prudential supervision of the business of electronic money institutions (the “Electronic Money Directive”), see Article 2(2).

9. FOREIGN EXCHANGE?

What then of virtual currencies which cannot (yet) be said to “pass in currency” within the jurisdiction? These may be of two kinds: (1) virtual currencies designed for a limited transactional purpose—for example, “in game” currencies which can only purchase virtual goods;²⁷ and (2) virtual currencies designed to serve as a medium of exchange in the “real world” and accepted by a limited set of market participants but which have, to date, not gained widespread acceptance.

The role of the latter may perhaps be said to be somewhat analogous to the role of foreign money in a jurisdiction where it is not legal tender. Foreign money is issued for the purpose of acting as a medium of exchange and, in at least one location, it is accepted and traded as payment, just as functionally “open” virtual currencies are accepted for payment in the real world within the user community. In the U.K., however, foreign money cannot purchase articles of commerce or satisfy a debt unless expressly stipulated for by the creditor. It cannot do so for an odd mix of reasons, both legal and socio-practical: foreign money is not sovereign currency or legal tender, there is no general social practice of accepting foreign money as payment and ordinary commercial debts within the jurisdiction are, by law, denominated in pounds sterling unless another currency is stipulated for.

Yet, under English law, foreign money is still regarded, in its legal aspect, as “money”. Any argument to the contrary was laid to rest by the Court of Appeal in *Camdex International Ltd v Bank of Zambia* [1997] CLC 714, where Phillips LJ noted that, in the event foreign currency is specified in a contract as the means of payment it retains its character as a medium of exchange. He went on to say:

this reflects the fact that there exist different media of exchange, that their relative values fluctuate over time and that for this reason parties to a transaction may be concerned to stipulate for a particular currency. The fact that the identity of the currency may be a material feature of

²⁷ “In game” currencies fall outside the remit of the FMLC, which is to consider legal developments in the framework of the wholesale financial markets. It has been suggested to the Committee, however, that “virtual transactions”—exchanging purpose-built virtual currencies for virtual securities—may, in future, be a useful innovation in financial markets infrastructure. It is said that innovations of this kind could offer intra-day settlement by means of proxy virtual transactions, which are then “converted” or “materialised” into net “real world” transactions at the end of the day. If these or similar developments occur, the FMLC may wish to consider the status and nature of purpose-built currencies with a limited sphere of transactional operation. Meanwhile, it should be noted that such currencies may, if pegged to “real world” currencies, constitute e-money within the definition above.

the transaction does not translate the currency into a commodity, whatever the nature of the transaction.

It is clear that foreign money also constitutes money for a host of purposes reflected in legislation—for example, the policy objectives of the Forgery and Counterfeiting Act 1981—including for the purposes of the Financial Collateral Arrangements (No 2) Regulations 2003, SI 3226/2003, where “cash” is:

money *in any currency* credited to an account, or a similar claim for repayment of money and includes money market deposits (emphasis added).

Crucially, there is no reason to believe that foreign money is not negotiable under English law, just like pounds sterling. Banknotes and coins will still, it is to be strongly inferred, count as negotiable chattels such that they can be transferred by mere delivery.²⁸ If so, it follows from what is said above about electronic money that a transfer of funds electronically will also deliver both possession and good title at common law to a recipient.

10. A CONSTANT MEASURE OF VALUE

This may be a good point at which to compare economic approaches to theorising virtual currencies and efforts to identify the legal aspect thereof. In its 2014 Q3 Quarterly Bulletin,²⁹ the Bank of England, in the course of considering innovative payment systems, observed that:

something may be considered money from the perspective of economic theory to the extent that it serves as a medium of exchange with which to make payment; a store of value with which to transfer ‘purchasing power’ (the ability to buy goods and services from today to some future

²⁸ Inferred, that is, from the prevailing practice and also from the approach taken by the Court of Appeal in *Camdex International Ltd v Bank of Zambia*. This result is the subject of authority under New York Law: *Brown v Pereira* (1918) 182 App Div 992; 176 NY Supp 215 (Supreme Court of New York).

²⁹ Available at: <http://www.bankofengland.co.uk/publications/Pages/quarterlybulletin/2013/a13.aspx>.

date); and a ‘unit of account with which to measure the value of any particular item for sale’.³⁰

A similar account was given by the European Central Bank in a paper on *Virtual Currency Schemes* published in October 2012.³¹ The paper concluded that virtual currencies do indeed act as a medium of exchange and as a unit of account within a particular virtual community—and qualify as “money” to that extent—but it questioned whether they were sufficiently reliable and safe to act as a “store of value”.³² In 2014, however, in the Q3 Quarterly Bulletin mentioned above, the Bank of England noted that DLT is adept at resolving the “double-spend problem”, reduces the credit, liquidity and operational risks that can beset more conventional payment systems and eliminates the fraud risk associated with identity theft or card theft.³³ It went on to observe that the “risk of direct loss of digital currencies is higher than that for deposits” but the loss of a virtual wallet remains “analogous to” the risk of loss of a physical wallet along with its contents in the form of coins and notes.³⁴ If this is correct, well-engineered virtual currencies are, in general, no less effective as a “store of value” than “real world” currencies. The one exception, noted the Bank of England, is the risk of system-wide fraud on cryptocurrencies like Bitcoin reflected in what is commonly called “the pool of miners scenario”. If would-be attackers were able to obtain sustained control of a majority of the total computing power across the

³⁰ *Ibid*, at p. 264.

³¹ Available at <https://www.ecb.europa.eu/pub/pdf/other/virtualcurrencyschemes201210en.pdf>.

³² *Ibid*, at p. 11. Virtual currencies are typically stored in e-wallets. Some of these are unencrypted, making them targets for experienced hackers. As regularly noted in the press, there are currently thought to be hundreds of hackers targeting virtual currency holders, stealing e-wallets and related identification information. For example, the ransomware virus Cryptolocker was successful in spreading through email attachments, encrypting hardware and infecting computers (<https://en.wikipedia.org/wiki/CryptoLocker>).

³³ Bank of England, *Quarterly Bulletin* (2014 Q3) *supra*, at p. 267-271. Virtual currencies are generally considered to benefit from the anonymity of the network because there is no identity verification and therefore no risk of identity theft. The FMLC notes, however, that the blockchain ledger is public, and that research has suggested that with the right knowledge pseudonyms (hashes of public keys) can be linked to the IP addresses where a transaction is generated.

³⁴ *Ibid*, at p.271. Safeguards, to ensure the veracity of transactions in virtual currencies have been adopted by all viable schemes and so the risks of counterfeiting have been largely eliminated. The risks associated with theft and loss, however, have proved much more persistent. Virtual currency transactions, owing to their technological nature, are irreversible and offer no legal protections for consumers against human error. Unlike credit cards, which offer chargeback protection, once units of virtual currency are transferred the transaction is irrevocable. Consumers do not have the benefit of the most common forms of redress in cases of financial loss, mistake or fraud because e-wallet providers, exchanges and trade platforms are not regulated and do not have a physical presence. This is largely a regulatory question rather than a legal-definitional one.

entire network of miners they could influence the speed, security and cost of the production and functioning of the cryptocurrency in question. As well as these technological risks there is a small practical risk that they could collude to disrupt or change the entire scheme.

Less robust cryptocurrency systems may contain features that can be exploited for the purposes of theft or fraud. In June 2016, a vehicle on the Ethereum platform was subject to such an attack, as mentioned above. The largest DAO on the platform was exploited by a user who successfully managed to drain over a third of DAO tokens into a “child DAO” using a recursive “splitDAO” function to withdraw his/her funds from the parent DAO multiple times.³⁵ While this attack exploited a weakness in the DAO, rather than in the Ethereum code itself, it is arguably the platform’s smart contract functionality which indirectly gave rise to the fraud risk. Moreover, efforts by users to recover the stolen Ether may have systemic consequences for the platform. One of the remedies suggested by some users has been to introduce a so-called “hard fork” in the blockchain which would orphan the funds in the child DAO and replicate them in the parent DAO. The stakeholder community has debated keenly whether this would potentially give rise to double spending thereby undermining both Ether’s fungibility and its capacity to act as a store of value.

Whether a particular virtual currency is sufficiently well-designed to eliminate double spending of units and minimise other risks to the framework so as to act as a “store of value” in this most basic sense is a threshold question which is beyond the scope of this paper. The FMLC notes that it may well be a question which is co-extensive with the threshold test identified at the outset of this paper, namely: whether a virtual currency scheme is sufficiently economically robust that the coins and tokens are capable of being classified as “property”, in the legal sense.

What is clear, however, is that the failure of a currency to act as a “constant measure of value”—a higher standard which would appear to combine the “store of value” aspect and the “unit of account” aspects—in no way prevents that currency from

³⁵ For more information on this topic, see <http://www.coindesk.com/understanding-dao-hack-journalists/> or <http://www.coindesk.com/the-dao-is-closing-down/>.

being money.³⁶ The better view is that a currency which cannot act as a robust store of economic value can nonetheless still qualify as “money” and can still be of negotiable character. This is clear from the analogy with foreign currency, which may rapidly devalue or appreciate in value against sterling but which will, following *Camdex International Ltd v Bank of Zambia*, still qualify as money for the purposes of English law.

11. REGULATORY ASPECTS

The fact that virtual currencies may, as to their legal aspect, have a strong claim to negotiability as “money”, does not necessarily entail that they should be treated as “money” in all contexts. Money is defined for a broad array of legal, economic and financial purposes and the analysis of virtual currencies in their relation to those definitions should not be rigidly pre-determined across all categories. Virtual currencies have similarities with money, commodities, securities and instruments of payment and it may be appropriate to regulate schemes by analogy with commodities or securities accordingly. In 2014, the Bank of England apparently agreed:

digital currencies are not at present widely used as a medium of exchange. Instead, their popularity largely derives from their ability to serve as an asset class. As such they may have more conceptual similarities to commodities, such as gold, than money.³⁷

In a similar vein, is the conclusion drawn last year by the U.S. Commodity Futures Trading Commission (“CFTC”) that Bitcoin is a commodity within the meaning of

³⁶ In *Treseder-Griffin v Co-operative Society* [1956] 2 QB 127 (CA) Lord Justice Denning (as he then was) said “sterling is the constant unit of value by which in the eye of the law everything else is measured”. He speculated that it might be contrary to public policy for a creditor to use a gold clause to index-link contractual payment obligations. In *Multiservice Bookbinding Ltd v Marden* [1979] Ch 84, Mr Justice Browne-Wilkinson (as he then was) rejected the public policy argument and noted that the English courts could award damages in other currencies (following *Miliangos v George Frank (Textiles) Ltd* [1976] AC 443). In each case, the failure of certain currencies to act as an adequate store of value was observed: in *Treseder-Griffin*, the court was prepared to characterise sterling as a constant measure of value but emphasised the correlative volatility of foreign currencies; and in *Multiservice Bookbinding* Browne-Wilkinson J was determined to recognise the realities of inflation by alluding to sterling as a currency “whose value is being eroded”.

³⁷ McLeay, Radia and Thomas, “Money in the modern economy: an introduction”, Bank of England Quarterly Bulletin 2014 Q1, p.6, available at: <http://www.bankofengland.co.uk/publications/Documents/quarterlybulletin/2014/qb14q1.pdf>.

section 1a(9) of the Commodity Exchange Act, where "commodity" is defined to include, among other things, "all services, rights, and interests in which contracts for future delivery are presently or in the future dealt in".³⁸ The relevant CFTC Order admits that this is a particularly broad definition.³⁹ The Commission would probably add, if asked, that the width of the definition is justified by the regulatory intent of the legislation.

The analogy with securities has also found favour with regulators. A year before the CFTC Order referred to above, the U.S. Securities and Exchange Commission ("SEC") obtained a final judgement from a U.S. district court against a Texan company—Bitcoin Savings and Trust—pursuant to federal security legislation that prohibits fraudulent offers and sales of "securities".⁴⁰ The court judgement ruled that Bitcoin-denominated units or shares in a Bitcoin-denominated Ponzi scheme run by founder, Trendon T. Shavers, met the definition of investment contracts and, as such, were securities.⁴¹

In the European context, regulatory questions of this kind cannot be postponed indefinitely (or, indeed, for very long at all). As virtual currencies play an increasingly significant role in the financial markets, the question of how the regulatory *acquis* should apply to them will become a pressing one. To take one example, virtual currencies may be used as collateral in financial transactions. If virtual coins and tokens are to benefit from key protections in the event of the insolvency of the collateral giver, the collateral taker or a relevant intermediary, certain chapters of the E.U. financial regulatory rulebook must apply. One instance of these protections is the guarantee of collateral enforceability afforded to collateral-takers by Article 4 of Directive 2002/47/EC on financial collateral arrangements (the "FCAD").⁴² The FCAD, which covers financial collateral consisting of cash,

³⁸ United States Commodity Futures Trading Commission, Order of the CFTC (Docket No. 15-29) in the Matter of Coinflip, Inc., d/b/a Derivabit, and Francisco Riordan, available at <http://www.cftc.gov/idc/groups/public/@lrenforcementactions/documents/legalpleading/enfcoinfliporder09172015.pdf>.

³⁹ *Ibid*, p. 3.

⁴⁰ Available at <https://www.sec.gov/litigation/litreleases/2014/lr23090.htm>.

⁴¹ See the court decision at: <http://www.law.du.edu/documents/corporate-governance/securities-matters/shavers/SEC-v-Shavers-No-4-13-CV-416-E-D-Tex-Sept-18-2014.pdf>.

⁴² This directive was implemented in the U.K. by means of the Financial Collateral Arrangements (No 2) Regulations 2003, referred to above.

financial instruments or credit claims,⁴³ defines “financial instruments” as shares in companies and:

other securities equivalent to shares in companies and bonds and other forms of debt instruments if these are negotiable on the capital market, and any other securities which are normally dealt in and which give the right to acquire any such shares, bonds or other securities by subscription, purchase or exchange or which give rise to a cash settlement (excluding instruments of payment), including units in collective investment undertakings, money market instruments and claims relating to or rights in or in respect of any of the foregoing.⁴⁴

It also defines cash as “money credited to an account in any currency”.⁴⁵ On the basis of the legal analysis above, it might be said that there is a good arguable case for classifying virtual coins and tokens—where certain threshold questions as to economic robustness etc. are satisfied—as “cash” within the meaning of the terms as they are used in the Directive and a much less cogent case for identifying some currencies as “securities”, but the question is best addressed as one of regulatory policy rather than legal categorisation.

The FMLC observes that, while a clear definition of the legal aspect of virtual currencies is not in any way conclusive as to their regulatory treatment, it may assist regulators in predicting the outcomes of proposed regulatory approaches. For instance, the legal risks to a payment settlement system which accepts payment in virtual currencies will differ depending on whether or not a good faith recipient receives good title based solely on delivery. If units of virtual currency are negotiable, as the analysis above suggests, title passes with delivery minimising the risk that the settlement system can be disrupted by “*nemo dat*” property claims brought by an antecedent owner.

⁴³ See Article 1(4)(a).

⁴⁴ Article 2(1)(e).

⁴⁵ Article 2(1)(d).

12. CONCLUSION

The objective of this paper has been to analyse the legal aspect of virtual currencies. The Committee has expressed the view that virtual currencies which have achieved status as a medium of exchange within a significant user community have a good claim to be regarded as money. If so, it follows that they will be negotiable. Since this does not sit easily with the traditional distinctions between choses in possession and choses in action there may be an argument for recognising the new reality of the digital world and extending the traditional legal categories so as to recognise virtual choses in possession as a new form of property.

This paper has not identified all issues of legal uncertainty arising in the context of virtual currencies but has, instead, identified various areas where more information is needed or a common approach is desirable. It is the Committee's hope that this paper will serve to raise awareness of the issues and as a springboard for further analysis and discussion.

ANNEX I - DEFINITIONS

The table below sets out definitions of virtual currency attributable to various commentators and authorities for a range purposes. The list is included for readers' interest.

Source	Definition
Japanese Payment Services Law, as amended (in translation)	<p>“Data of value which are transferrable by electronic data processing systems among miscellaneous parties, which can be used as payment in exchange for other goods or services, which are not denominated or redeemable in domestic or foreign monetary unit of account, and which can itself be purchased and sold.</p> <p>Data of value which are transferrable by electronic data processing system among miscellaneous parties and which can be exchanged with such virtual currency are also regarded as virtual currency.”</p>
European Central Bank, “Virtual Currency Schemes”, October 2012, p.5	“A type of unregulated, digital money, which is issued and usually controlled by its developers, and used and accepted among the members of a specific virtual community.”
European Central Bank, “Virtual Currency Schemes – a further analysis”, February 2015, p.25	“Virtual currency can... be defined as a digital representation of value, not issued by a central bank, credit institution or e-money institution, which, in some circumstances, can be used as an alternative to money.”
European Banking Authority, “EBA Opinion on ‘virtual currencies’”, 4 July 2014, p.10	“The usage of the term ‘currency’ is misleading... VCs are defined as a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a FC [Fiat Currency], but is used by natural or legal persons as a means of exchange and can be transferred, stored or traded electronically.”
Financial Action Task Force Report <i>Virtual Currencies: Key Definitions and</i>	“Virtual currency is a digital representation of value that can be digitally traded and functions as (1) a medium of

<p><i>Potential AML/CFT Risks</i> (June 2014), p.4</p>	<p>exchange; and/or (2) a unit of account; and/or (3) a store of value, but does not have legal tender status (i.e., when tendered to a creditor, is a valid and legal offer of payment) in any jurisdiction. It is neither issued nor guaranteed by any jurisdiction, and fulfils... functions only by agreement within the community of users of the virtual currency.”</p>
<p>Ali & Barrdear (Bank of England) “Innovations in payment technologies and the emergence of digital currencies”, p.5</p>	<p>“Bitcoin...is a privately developed, internet-based currency and payment system that requires no intermediaries (like banks) for the processing of payments. Furthermore, the supply of bitcoins is not controlled by central banks. It is commonly referred to as a ‘cryptocurrency’ as it relies on techniques from the field of cryptography to ensure the secure validation of transactions.”</p>
<p>Brito, Shadab, Castillo, “Bitcoin Financial Regulation: Securities, Derivatives, Prediction Markets, and Gambling” [2014] Colum. Sci. & Tech. L. Rev 144, p.147.</p>	<p>“Bitcoin is frequently described as “digital currency.” While that description is accurate, it can be misleading as it is both too broad and too narrow. It is too broad because Bitcoin is a very particular kind of digital currency called a cryptocurrency... On the other hand it is too narrow because although currency is one aspect of the Bitcoin system, Bitcoin is more broadly an Internet protocol with many applications beyond payments or money transfer, such as recording property titles and authenticating documents.”</p>
<p>United States District Court, <i>Securities and Exchange Commission v Trendon T. Shavers and Bitcoin Savings and Trust</i></p>	<p>“It is clear that Bitcoin can be used as money. It can be used to purchase goods or services... The only limitation of Bitcoin is that it is limited to those places that accept it as currency.”</p> <p>“It can also be exchanged for conventional currencies, such as the U.S. dollar, Euro, Yen, and Yuan. Therefore, Bitcoin is a currency or form of money, and investors wishing to invest in BTCST provided an investment of money.”</p>

<p>Derek A. Dion, “I’ll Gladly Trade you Two Bits on Tuesday for a Byte Today: Bitcoin, Regulating Fraud in the Economy of Hacker-Cash” <i>Illinois Journal of Law, Technology & Policy</i> (2013, Vol 1) 165</p>	<p>“Bitcoin is an electronic form of currency unbacked by any real asset and without specie, such as coin or precious metal.”</p> <p>“It is not regulated by a central bank or any other form of governmental authority; instead, the supply of Bitcoins is based on an algorithm which structures a decentralized peer-to transactions system.”</p>
<p>United States Internal Revenue Service, Notice 2014-21</p>	<p>“Virtual currency is a digital representation of value that functions as a medium of exchange, a unit of account, and/or a store of value. In some environments, it operates like “real” currency – i.e., the coin and paper money of the United States... and is customarily used and accepted as a medium of exchange... but it does not have legal tender status in any jurisdiction.”</p>
<p>United States Department of the Treasury, Financial Crimes Enforcement Network Guidance FIN-2013-G001⁴⁶</p>	<p>“In contrast to real currency, “virtual” currency is a medium of exchange that operates like a currency in some environments, but does not have all the attributes of real currency. In particular, virtual currency does not have legal tender status in any jurisdiction. ...“convertible” virtual currency...either has an equivalent value in real currency, or acts as a substitute for real currency.”</p>
<p>Swiss Confederation “Federal Council report on virtual currencies in response to the Schwaab (13.3687) and Weibel (13.4070) postulates” of June 25, 2014, p.7</p>	<p>“The Internet has provided interested parties with the opportunity to create virtual communities on the net, and some of these communities have also created their own electronic means of payment, thereby creating a new form of money. A virtual currency is a digital representation of value which can be traded on the Internet and although it takes on the role of money – it can be used as a means of payment for real goods and services – it is not accepted as legal tender anywhere. These currencies have their own denominations. They differ from e-money in that they are not based on a</p>

	<p>currency with legal tender status. Virtual currencies exist only as a digital code and therefore do not have a physical counterpart for example in the form of coins or notes. Given their tradability, virtual currencies should be classified as an asset.”</p>
--	--

ANNEX II – COMPUTER SOFTWARE: GOODS OR SERVICES?

Computer programs themselves, while self-evidently “things” in the lay sense, would appear to be neither choses in possession nor choses in action. A person’s copyright in, or patent over, a program is—where available—a chose in action but this is distinct from a person’s having general property in the software itself. English law does not appear to recognise a “computer program” as a “thing” at all and the expression is not defined.⁴⁷

This lack of “thing-ness” is reflected in the judgment, 20 years ago, of Sir Iain Glidewell in the Court of Appeal in *St Albans City and District Council v International Computers Ltd* [1996] 4 All ER 481. In rejecting the idea that a computer program could be “goods” within the meaning of the Sale of Goods Act 1979 and/or the Supply of Goods and Services Act 1982, where “goods” are “all personal chattels other than things in action and money”,⁴⁸ Sir Iain said (at p. 493), somewhat elliptically: “Clearly a disk is within this definition. Equally clearly, a program, of itself, is not.” Here, he appears to have reached his conclusion not on the grounds that a program is an incorporeal “thing in action” (and so expressly excluded from the statutory definition of “goods”) but rather on the grounds that a program is not a thing at all. He was persuaded, he said, by the view that software is merely “a set of instructions” for a computer, analogous to an “instruction manual on the maintenance and repair of a particular make of car”, or an “algorithm” which, when encoded, enhances physical goods in the form of a computer disk.

Given that neither of the analogies favoured by Sir Iain seems to have kept pace with developments in computer software, it is pertinent to ask whether they remain apposite for the contemporary world. Today, millions of retail users can download programs or “apps” from the internet directly to mobile devices and anything which Sir Iain would have recognised as a disk is pretty much wholly obsolete. Moreover, the activity of providing or using just one software program can constitute the entire commercial strategy of a business. And, of course, there are virtual currencies, computer code written—or “mined”—purely for the sake of its intrinsic value to the user and not for its ability to regulate any hardware function or activity. These are radical changes which even the technology companies of the 1990s failed to predict.

⁴⁷ See *Halsbury’s Laws of England* (2013), Vol. 23, para. 617.

⁴⁸ That is, under English Law. Section 18 provides “as regards Scotland” that “goods” also comprises “all corporeal moveables”.

In 1999, for example, Microsoft wrote that the electronic delivery of programs would “never” entirely replace traditional delivery by disk.⁴⁹ They make Sir Iain Glidewell’s characterisation of software programs as a mere “instruction manual” for hardware look a little out-dated.

It is, perhaps, also pertinent to ask whether a legal framework for the technology markets which does not recognise general property in a computer program may inadvertently be impeding the development of those markets—just as a failure to recognise property in credit might have impeded the development of the financial markets. Such enquiries are, however, beyond the remit of the FMLC and the scope of this paper.

The rejection of the idea that a computer program can constitute “goods” unless it is “locked in” to a disk or other medium has led some to take the view that the purchase of a computer program may be, in fact, a contract for the supply of services, at least for the purpose of applying tariffs to cross-border trade. In 1990s, CD-ROMs delivering computer software were classified as “goods” subject to the General Agreement on Tariffs and Trade (“GATT”). By 1999, however, it was clear that computer software would increasingly be transmitted by electronic means and a debate emerged about whether these transmissions should be regarded as services, subject to the General Agreement on Tariffs and Services (“GATS”), or as a new category of “virtual goods” subject to GATT, as intellectual property subject to the TRIPs Agreement on Trade-Related Intellectual Property, or as something else.⁵⁰

Unsurprisingly, perhaps, Microsoft argued, in its 1999 white paper to the World Trade Organisation (“WTO”), that digitally delivered software should be classified exclusively as intellectual property, thus occupying a tariff-free zone.⁵¹ This appears, broadly, to be the approach that prevailed at the WTO: encoded disks continue to qualify as “goods”, along with certain other categories of software embedded in items of computer hardware; bespoke developer services qualify as “consultancy” and thus services and other kinds of digitally-delivered programs fall outside the tariff regimes except in so far as they constitute intellectual property.

⁴⁹ See Microsoft, “WTO and Electronic Commerce: Issues for World Trade” (September 8, 1999), at section I(E) (*Classification of Software*). The paper is available at: <https://www.microsoft.com/issues/essays/1999/11-15wto-b.mspx>.

⁵⁰ Microsoft, *ibid.*

⁵¹ *Ibid.*

While Microsoft's preferred approach may be logical and even satisfactory from a fiscal perspective, it may need closer examination from the market perspective. A lack of general property in computer software prevents the transfer for value of any special property (other than intellectual property) in software. It prevents, for example, a business which has acquired from a developer a very expensive copy of a computer program assigning a security interest in that program to raise funds (unless it has also acquired the copyright). As technologies like blockchain and DLT improve developers' ability to privilege a single piece of code in the system in a way such that all other system participants can be required automatically to acknowledge individual "ownership" of that code, the notion that there is no general property in a digitally-delivered computer program starts to look less and less like a serviceable hypothesis on which to build a legal framework for the technology markets of the future.

Given this, the FMLC considers there to be a good arguable case for the legal recognition of general property in, at least, some computer programs or computer code. Further, in light of what is said above about transferability and value, the FMLC considers that, were there to be a re-consideration of computer code for the purposes of legal classification, virtual currencies would be a useful heuristic for that re-framing exercise.

**VIRTUAL CURRENCIES: ISSUES OF LEGAL UNCERTAINTY,
AN ADDENDUM
DECEMBER 2016**

Financial Markets Law Committee

An Addendum to the FMLC Discussion Paper on Issues of Legal Uncertainty Arising in the Context of Virtual Currencies

December 2016

www.fmlc.org

Financial Markets Law Committee

This addendum has been prepared by:

Antony Zacaroli QC

South Square

with the assistance of the FMLC Secretariat.¹

¹ Joanna Perkins, FMLC Chief Executive and Venessa Parekh, FMLC Communications Officer

In July 2016, the Financial Markets Law Committee (the “FMLC” or the “Committee”) published a paper prepared by the FMLC secretariat following discussion in a working group convened to consider areas of legal uncertainty in relation to virtual currencies. In that paper, the Committee expressed the view that the virtual currencies which have achieved status as a medium of exchange within a significant user community have a good claim to be regarded as money.

Since publication of that paper, two decisions in the U.S. have taken conflicting views on the question whether Bitcoin, one of the most commonly used forms of virtual currency, is to be regarded as money. The context in which the question arises for consideration is critical to the interpretative outcome and, in both cases, the context was the term “money” within a criminal statute.

In the first case, *Florida v Espinoza*² the defendant was accused of unlawfully selling Bitcoin in contravention of §560.125(5)(a), Fla. Stat., which prohibited an unlicensed person from engaging in the business of a “money services business”. The definition of money services business included a person who acts as a “payment instrument seller”, and “payment instrument” is defined as

a check, draft, warrant, money order, travellers check, electronic instrument, or other instrument, payment of money, or monetary value whether or not negotiable.

The judge concluded that the defendant was not a payment instrument seller because Bitcoin did not fall within the definition of “payment instrument”, relying in part on an IRS statement that virtual currency was treated as property for federal tax purposes. The judge noted:

While Bitcoin can be exchanged for items of value, they are not a commonly used means of exchange. They are accepted by some but not by all merchants or service providers. The value of Bitcoin fluctuates wildly and has been estimated to be eighteen times greater than the U.S. dollar ... With such volatility they have a limited ability to act as a store of value, another important attribute of money.

² No.F.14-293 (Fla. Cir. Ct. July 22, 2016)

She concluded,

The Court is not an expert in economics, however, it is very clear, even to someone with limited knowledge in the arena, that Bitcoin has a long way to go before it is the equivalent of money.

In the second case, *U.S. v Murgio*, the United States District Court, Southern District of New York, took a different view. The defendant was charged with operating and conspiring to operate a “money transmitting business” in violation of 18 U.S.C. §1960. “Money transmitting” was defined as including “transferring funds on behalf of the public by any and all means...” The court held that Bitcoin are “funds” under the statute, since the ordinary meaning of the term “funds” included money and “money” is in turn defined as “something generally accepted as a medium of exchange, a measure of value, or a means of payment.”

In reaching this conclusion, the court commented that Bitcoins can be accepted as a payment for goods and services, or bought directly from an exchange, such that they function as pecuniary resources, and are used as a medium of exchange and a medium of payment.

The *Espinoza* decision was held to be wrong, the New York court concluding that the judge in *Espinoza* had considered only the possibility that Bitcoin was a “payment instrument” for the purposes of §560.125(5)(a), Fla. Stat., and had not considered the possibility that it was “monetary value”. In *Murgio*, the court concluded that

there is no plausible interpretation of monetary value or payment instruments as the terms are used in Chapter 560 that would place Bitcoins outside the statute’s ambit.

It further noted that the fact that the IRS had decided to treat virtual currency as property for federal tax purposes had no relevance to the question whether Bitcoins qualify as payment instruments under Florida law.

5. IMPACT	13
6. POTENTIAL SOLUTIONS	14
7. THE FMLC'S PROPOSED SOLUTION	21
8. CONCLUSION	23

1. INTRODUCTION AND BACKGROUND

- 1.1. The role of the Financial Markets Law Committee (the “FMLC”) is to identify issues of legal uncertainty or misunderstanding, present and future, in the framework of the wholesale financial markets which might give rise to material risks and to consider how such issues should be addressed.
- 1.2. Distributed Ledger Technology (“DLT”) systems¹ are often borderless, spanning several jurisdictions and leaving market infrastructures, regulated firms, members of the public and others conducting transactions thereupon vulnerable to multiple—and potentially inconsistent—assertions of governing law. Such multiple assertions stem from the fact that it might be less than clear where assets and their records are located in a DLT environment.² For both participants in a DLT system—and any affected third parties—uncertainty as to governing law is self-evidently neither a satisfactory nor a viable outcome.
- 1.3. One need only consider the immense scale of research being conducted by the financial sector into DLT,³ the targeted applications of DLT that have already been brought to market in 2017,⁴ and DLT’s status as “the bedrock of the “New Industrial Revolution”⁵ (notwithstanding the absence of agreement as to DLT’s significance in practice)⁶ to recognise the increasing relevance of DLT and the pressing need for international consensus on this issue of governing law. As the law relating to DLT lags behind the trajectory of the technology, an international conflict of laws

¹ For the avoidance of doubt, a DLT system need not be a formal “system” in the technical or engineering sense of the word.

² See ESMA, *The Distributed Ledger Technology Applied to Securities Markets* (7 February 2017) para.72, available at: <https://www.esma.europa.eu/press-news/esma-news/esma-assesses-dlt%E2%80%99s-potential-and-interactions-eu-rules>.

³ See slide 14 of World Economic Forum “The future of financial infrastructure: an ambitious look at how blockchain can reshape financial services” (presentation prepared in collaboration with Deloitte) (August 2016), available at: http://www3.weforum.org/docs/WEF_The_future_of_financial_infrastructure.pdf.

⁴ See, for example: (i) Daimler AG and Landesbank Baden-Württemberg (LBBW)’s successful launch of a 1 year corporate *Schuldschein* with a volume of €100 million in [June 2017](#), where the entire transaction was carried out digitally via blockchain technology; (ii) distributed ledger specialists Axoni, in conjunction with eleven firms (including BNP Paribas, Credit Suisse, Goldman Sachs, J.P. Morgan, Thomson Reuters and ISDA) announced [on 20 November 2017](#) the successful completion of a pilot to manage equity swap transactions and related post-trade lifecycle events employing blockchain smart contracts; and (iii) in [August 2017](#) six of the world’s biggest banks (including Barclays and HSBC) announced that they have joined a project, pioneered by UBS, to create a new form of digital cash called a “utility settlement coin” that they hope to launch next year for clearing and settling financial transactions over blockchain.

⁵ See the G20 Insight Report, *The G20 Countries Should Engage with Blockchain Technologies to Build an Inclusive, Transparent, and Accountable Digital Economy for All* Mauplin, J (Max Planck Institute for Comparative Public Law & International Law & Centre for International Governance Innovation, 5 April 2017), available at: http://www.g20-insights.org/policy_briefs/g20-countries-engage-blockchain-technologies-build-inclusive-transparent-accountable-digital-economy/.

⁶ On DLT’s “awkward adolescent phase”, see Morgan Stanley “Blockchain: Unchained?” (8 September 2017), available at: <https://www.morganstanley.com/ideas/blockchain-unchained>.

framework for financial transactions and systems using DLT needs to be developed as a matter of priority.

2. A WORD AS TO SCOPE

- 2.1. A transaction in a financial instrument or asset on a DLT system (where a transaction is taken to involve the transfer of value, whether by disposition or charge, from one participant to another participant, resulting in a change of legal rights and duties of each participant) may give rise to numerous issues: under private law, contractual, tortious and property; under insolvency law, and criminal law.
- 2.2. In this paper, in order to discourage prolixity and to encourage clarity of thought, the FMLC will focus on the proprietary effects of DLT transactions in financial instruments or assets.⁷ This focus on the proprietary effects is not, however, entirely artificial, given the need for certainty as to how proprietary issues of transfer, priority, and security perfection will be governed within a financial services context. The choice is also informed by the significant uncertainties—to be explored in full below—that arise when attempting to ascertain the governing law in respect of the proprietary effects of DLT transactions: uncertainties which are perhaps less pronounced for other areas of law. Finally, the reader may recall that similar concerns as regards proprietary effects followed the rise of computerisation in financial services; concerns associated with the holding of dematerialised securities on an intermediated basis through custodians in a holding system. Owing to some (at least superficial) similarities between these two developments—both involve the holding of assets in a novel way through a computerised system—the historical proprietary treatment of transactions in intermediated securities will inform some of the analysis below.⁸
- 2.3. This paper will examine what is meant by “DLT system” (Section 3). From this foundation, the paper will then consider the issue of legal uncertainty (Section 4) and its impact (Section 5), before considering possible solutions (Section 6) and, ultimately,

⁷ Readers are asked to bear in mind that remit of the FMLC is limited to the study of issues affecting the wholesale legal markets.

⁸ National legal systems may reach divergent positions as to whether DLT-system-based tokens qualify as an object of ownership and tests for determining owners (undermining the possibility for proprietary claims), but such fundamental legal uncertainty may be mitigated if the governing law is predictable. See Takahashi, K “Implications of the Blockchain Technology for the UNICTRAL Works” at p.17, available at: http://www.uncitral.org/pdf/english/congress/Papers_for_Programme/30-TAKAHASHI-Implications_of_the_Blockchain_Technology_and_UNCITRAL_works.pdf

setting out the FMLC’s proposed solution (Section 7).

3. DLT SYSTEMS

3.1. The European Securities Markets Authority (“ESMA”) has observed that DLT systems can be characterised as:

- a) records of electronic transactions which are maintained by a shared or “distributed” network of participants (known as “nodes”), thereby forming a distributed validation system; that
- b) make extensive use of cryptography i.e. computer-based encryption techniques such as public/private keys and hash functions which are used to store assets and validate transactions on distributed ledgers.⁹

3.2. Different nodes may have different rights with respect to, for example, reading and writing data.¹⁰ Fully decentralised networks, where there is no central validation system and no central point of control, are a further subset of distributed networks.¹¹ It is worth noting that distributed ledger technology is sometimes referred to as “blockchain”, owing to the fact that some iterations of the technology operate to create a chain of blocks (or files) containing transaction data.¹²

3.3. The specifics of DLT systems (and their underlying technology) are diverse and the category is still evolving. Nevertheless, the FMLC is given to understand that three broad distinctions may be drawn out which provide a helpful base for legal analysis:

⁹ ESMA Report, *supra* n.2 at p.4.

¹⁰ FCA, *Discussion Paper on distributed ledger technology* (April 2017) DP 17/3, p.10, available at: <https://www.fca.org.uk/publication/discussion/dp17-03.pdf>.

¹¹ For background on how different ledger technologies vary in their degrees of centralisation, see U.K. Government Office for Science *Distributed Ledger Technology: beyond block chain* (19 January 2016) at p.35, available at: https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/492972/gs-16-1-distributed-ledger-technology.pdf.

¹² In such a system, each new block contains a derived form (i.e., a hash) of the previous block. These blocks are stitched together in a chain of increasing length, the authenticity of which is verified by the combined computing power of multiple users on the network. The chain is extended when new transactions are organised into new blocks which are then added to the end of the existing blockchain and resubmitted to the network. Once accepted by the distributed network, a block cannot be changed or removed. A block which is created but rejected by the network becomes orphaned and cannot be reintegrated into the system. This is designed to prevent transactions being duplicated and to eliminate the re-use (or “double spend”) of coins or tokens. See FMLC “Issues of legal uncertainty arising in the context of virtual currencies” (July 2016) p.2, available at http://www.fmlc.org/uploads/2/6/5/8/26584807/virtual_currencies_paper_-_edited_january_2017.pdf.

- a) **Permissionless and permissioned systems:** permissionless systems are open to the public, and members of the public may effect and verify changes to the ledger. By contrast, in permissioned systems only authorised participants are able to create records and verify changes to the ledger (and different participants may have different authorisations).¹³
- b) **Record and title ledgers:** record ledgers evidence or record title transfers carried out through underlying transaction documentation (and can, for instance, be used for transaction reporting). Title ledgers, by contrast, transfer title directly on the ledger. For some classes of assets, a title transfer will only be effective if the ledger is authoritative and constitutive and, normally, a change in the law will be required to confer the requisite authority. In the case of shares, for example, the ledger will need to be deemed equivalent to a company’s register of members in order for legal title to transfer.¹⁴
- c) **Off-platform asset tokens and on-platform asset tokens:**¹⁵ DLT systems may circulate (and effect transactions via) off-platform asset tokens, which represent or are “pegged to” underlying “real world” assets. These assets could be tangible (like land, coffee beans or oil), or intangible (like debt or shares).¹⁶ DLT systems may also circulate (and effect transactions via) on-platform asset tokens (or “virtual assets”) which are assets created within—and have value that is entirely derived from—the sphere of the DLT system, with no underlying asset referenced. They can be monetary tokens (i.e. cryptocurrency), a well-known example of which is Bitcoin, or digital securities.¹⁷ Both kinds of tokens can be a mere record of ownership, or can be “smart” and have rights and obligations attached to them. In future, the

¹³ The FMLC is aware of a further distinction between permissioned and private systems. In permissioned systems, the ledger may be viewed by members of the public, but only accessed by authorised participants. Private systems are only able to be viewed and accessed by authorised participants. For the purposes of this paper, “permissioned” systems will be taken to encompass private systems.

¹⁴ In such a scenario, a share token will be a digital version of a share certificate. See ENISA *Distributed Ledger Technology & Cybersecurity; Improving information security in the financial sector* (December 2016), at p. 25, available at: <https://www.enisa.europa.eu/publications/blockchain-security>.

¹⁵ An introduction to this distinction can be found at Lewis “A gentle introduction to digital tokens” (28 September 2015), available at <https://bitsonblocks.net/2015/09/28/a-gentle-introduction-to-digital-tokens/>, and a SWIFT presentation entitled “Distributed Ledger Technologies” (Alexandre Kech, 11 May 2016) available at <https://www.swift.com/file/27666/download?token=e6t9sW0p>.

¹⁶ On tangible and intangible assets, see Dicey, Morris & Collins, *The Conflict of Laws*, 15th ed, §22-010.

¹⁷ Note that digital securities are distinct from dematerialised securities, which are created under the Uncertificated Securities Regulations 2001 (SI 2001/3755) as amended in 2003 (SI 2003/1633), 2009 (SI 2009/1889) and 2013 (SI 2013/632).

distinction between off-platform asset tokens and on-platform asset tokens is likely to blur, as it is possible that when certain assets are “digitised” and represented on a DLT system, the new digital assets may end up replacing the original real world assets. It will be for regulators—on a case-by-case basis—to determine how assets traded on a given DLT system are to be classified for regulatory purposes; that is, whether in the specific instance they are securities, commodities, funds, money, instruments of payment, derivatives, records or something else altogether in relation to each relevant regulation.¹⁸

- 3.4. While many other distinctions may be drawn (for instance, between those ledgers where there are tokens and those which are entirely tokenless), it is these three that will prove most productive for the purposes of the conflict of laws questions posed in this paper. The paper will, moreover, focus on title ledgers, and references to “DLT systems” in the paragraphs below should be taken to mean DLT systems with title ledgers. This is because, in the case of record ledgers, the question of governing law in relation to the proprietary effects of transactions on the ledger will be determined through the application of traditional conflict of laws rules to the underlying transaction that is being recorded; as a result, the governing law is not uncertain in respect of record ledgers.

4. THE ISSUE OF UNCERTAINTY

- 4.1. The traditional property rules of private international law—given a natural historical focus on tangible goods—dictate that a question as to rights or entitlement should be governed by the law of the place in which the property or claim to property is situated (*lex situs*). As per Dicey, Morris & Collins (§22-025):

...the rationale for the application of the *lex situs* to many questions of property law is, first, that the *situs* is an objective and easily ascertainable connecting factor to which third parties might

¹⁸ For example, the Securities and Exchange Commission in the U.S. has stated that tokens offers and sales of digital assets by “virtual” organisations could be subject to the requirements of the federal securities laws, highlighting that whether a particular investment transaction involves the offer or sale of a security—regardless of the terminology or technology used—will depend on the facts and circumstances, including the economic realities of the transaction. A press release to this effect, dated 25 July 2017, can be found here: <https://www.sec.gov/news/press-release/2017-131>

See also the FMLC’s paper on the legal and regulatory classification of virtual currencies, (*supra*, n.13), with an addendum to this paper available at http://www.fmlc.org/uploads/2/6/5/8/26584807/an_addendum_to_the_fmlc_discussion_paper.pdf.

reasonably look to ascertain questions of title and, secondly, that the country of the *situs* has control over the property and a judgment in conflict with the *lex situs* will often be ineffective.

- 4.2. This rationale has less force the further that one moves from that paradigm case. The very concept of a single *situs* for the asset becomes difficult to apply in the case, first, of intangibles, second, of digitised assets and, third, of assets constituted on a distributed network or platform. In England and Wales, for example, at common law, a *chose* in action was at one time thought to have no *situs*,¹⁹ but rules were subsequently developed to identify the *situs* for a variety of *choses* in action (e.g. in the case of a debt, the place where the debtor resides; or, in the case of a share in a company, the place of incorporation of the company or the place of the register upon which any transfer must be registered to be effective).²⁰ Notwithstanding the fact that the common law of England and Wales had arrived at a solution to the problem of intangible property by this route, however, European law took a different approach. The Convention on the law applicable to contractual obligations (the “**Rome Convention**”), and later Regulation (EC) No 593/2008 on the law applicable to contractual obligations (the “**Rome I Regulation**”), determined that *inter partes* proprietary questions arising from transactions in *choses* in action would be governed not by the *lex situs*—a cumbersome, difficult rule to apply in this context—but by the governing or applicable law of the contract giving rise to the claim.²¹
- 4.3. When attempting to determine the proprietary effects of a transaction there are, therefore, well-established precedents for both adapting—and even departing from—the *lex situs* rule where necessary.

Lex situs as applied to DLT systems

- 4.4. In addition to its traditional use, in recent years the *lex situs* has been employed in respect of intermediated securities via the so-called PRIMA principle. As noted above, at first glance there may appear to be certain parallels between the market developments which introduced securities intermediation and those which relate to the introduction of DLT systems. The advent of dematerialisation and intermediation in

¹⁹ *Lee v Abdy* (1886) 17 QBD 309, 312.

²⁰ Dicey, Morris & Collins, at §22-044.

²¹ Regulation (EC) No 593/2008 of the European Parliament and of the Council of 17 June 2008 on the law applicable to contractual obligations (Rome I), available at: <http://eur-lex.europa.eu/legal-content/en/ALL/?uri=CELEX%3A32008R0593>.

the securities market created a new “thing” (i.e. the book-entry) which was initially viewed as a means of record-keeping in the custody and holding chain but which subsequently came to be recognised and fully-accepted as the locus of proprietary rights.

- 4.5. The PRIMA principle was initially developed during negotiations for The Hague Convention of 5 July 2006 on the Law Applicable to Certain Rights in Respect of Securities (effective as of 1 April 2017, the “**Hague Securities Convention**”), and pinpoints a method to determine the *lex situs* of securities held with an intermediary, looking to the jurisdiction of the “place of the relevant intermediary account”.²² This original PRIMA principle, although not incorporated into the Hague Securities Convention, now appears in E.U. law in three different instruments relating to book-entry securities: Directive 2002/47/EC on financial collateral arrangements (the “**FCAD**”); Directive 98/26/EC on settlement finality in payment and securities settlement systems (the “**SFD**”); and Regulation (EU) No 909/2014 on improving securities settlement in the European Union and on central securities depositories (the “**CSDR**”).
- 4.6. The *lex situs* does not, however, translate well when applied to a DLT system. The *situs* of an asset constituted on a DLT ledger—which by definition is distributed—is not immediately obvious. A network can span several jurisdictions and—in the case of a ledger which is fully decentralised—there is no central authority or validation point.
- 4.7. The application, then, of the *lex situs* as a connecting factor—or of any conflict of laws rule anchored in geography—is problematic in the DLT context. It gives rise to difficulty in attempting to answer key questions:
 - a) What are the legal nature and effects against third parties of a disposition of an asset recorded on a DLT system?
 - b) What are the requirements—if any—for the perfection of a disposition of an asset recorded on a DLT system?
 - c) What are the requirements—if any—for the realisation of an interest in an asset recorded on a DLT system?

²²

This is because in an intermediated holding system it is impractical to apply the law of the place where the securities are located at the time of the transfer (in this context, *lex cartae sitae*). See the HCCH, *Hague Securities Convention, Explanatory Report*, second edition, at 18 for reasoning, available at: <https://assets.hcch.net/docs/d1513ec4-0c72-483b-8706-85d2719c11c5.pdf>.

- d) Does a disposition of an asset recorded on a DLT system extend to entitlements to dividends, income, or other distributions, or to redemption, sale or other proceeds?
- e) What are the legal nature and effects against the transferor of a disposition of an asset recorded on a DLT system? and
- f) What are the circumstances in which a person's interest in an asset recorded on a DLT system will extinguish or have priority over another person's interest?²³

4.8. Before abandoning the *lex situs* as a connecting factor altogether, however, it is important to note that where DLT arrangements purport to be dispositive of title to tangible property, and immovable property in particular, it appears unlikely that a court will apply any law other than the *lex situs* of the underlying asset. The conflict of laws analysis in respect of a DLT system need not necessarily, then, be radically different just because there is new technology underpinning a transaction. In fact, in some contexts, a traditional conflict of laws analysis may be the most appropriate route to the answer.

4.9. Overall, it is clear that further investigation is needed into the application of conflict of laws rules other than—or, at the least, in addition to—the *lex situs* to deal with new challenges posed by DLT.

Excluded issues

4.10. There are a number of peripheral and interconnected issues of legal uncertainty that arise when considering the governing law of the proprietary aspects of transactions conducted on a DLT ledger. In order to give focus to this paper, they will not be considered here. The FMLC thought it worth flagging these issues, however, as they are relevant and may merit future consideration; they are listed in the form of questions at Appendix A.

4.11. In addition to these issues, this paper does not attempt to address ancillary conflict of laws questions such as the application of *renvoi* (the process through which the court adopts the rules of a foreign jurisdiction where a conflict of laws issue arises) and/or the need for public policy exceptions.

²³ Article 2 of the Hague Securities Convention was used as a reference when creating this list of issues.

5. IMPACT

- 5.1. It is clearly desirable that participants in a DLT system have confidence that transfer, priority and security perfection benefit from legal finality. Moreover, from a regulatory perspective, and from the perspective of legal or natural persons participating within the DLT system, legal certainty on the issues discussed in this paper will be a prerequisite to the mainstream adoption of DLT systems in financial transactions.
- 5.2. A complementary point has been highlighted in a paper published by *Long Finance* in July 2017. Despite often being described as “trustless” (owing to their structure), DLT systems are built on trust, and factors such as theft, security, and dispute resolution affect trust. If trust is eroded, the number of users of DLT systems will decrease and the value of the network to the remaining users is diminished. Applying this reasoning, legal uncertainty as to the governing law of the proprietary effects of a transaction on a DLT system could diminish trust in the system, and thereby diminish its value.²⁴
- 5.3. Continuing legal uncertainty in this area has, therefore, the potential to stifle the growth of DLT within the financial sphere, and reduce the benefits and efficiencies that many claim it has to offer. A recent report published by the European Union Agency for Network and Information Security (“**ENISA**”), succinctly describes these as:
- a) **cost reductions:** the opportunity for financial institutions to unplug legacy systems and reduce the amount of layers for data sharing, as well as reducing reconciliation time;
 - b) **risk-management:** the ability to predict and avoid overextending an institution’s liabilities; and
 - c) **regulatory compliance:** compliance with the requirements of various sets of legislation, as well as conducting only authorised transactions can be automated to a great degree.²⁵

²⁴ S.Mills and B.McDowall, *Long Finance*, “Responsibility without power? The governance of mutual distributed ledgers (aka blockchain)” (July 2017) at p.20, available at: http://www.longfinance.net/images/Responsibility_Without_Power.pdf.

²⁵ ENISA, *supra* n.15.

- 5.4. As the technology matures, moreover, new benefits to DLT are likely to be identified. The impact of legal uncertainty in this area is, in any event, significant and it is a matter of relative urgency that a solution is found. It is to the question of a solution that this paper now turns.

6. POTENTIAL SOLUTIONS

- 6.1. It was highlighted at the beginning of this paper that DLT systems are often international in their reach, involving participants from all over the globe. As a result, and in order to be effective, any solution will have to be adhered to on an international basis. As a means of achieving this goal, the FMLC advocates that guidelines model conflicts rules are adopted by an international body or group, such as the Hague Conference, perhaps in collaboration with the International Institute for the Unification of Private Law (“UNIDROIT”).
- 6.2. What follows is a description of a number of potential solutions—or rather, connecting factors—which present themselves when considering possible choice of law rules for the proprietary effects of transactions conducted on DLT systems. Advantages and disadvantages of each solution are also analysed, and principles such as the need for the connecting factor to be objective and easily ascertainable, practical to apply, and for the country in question to have control over the asset have been taken into account.²⁶ This is followed with the FMLC’s proposed solution at Section 7, below.

Lex Situs

- 6.3. Paragraphs 4.6 and 4.7, above, examine the limitations of the *lex situs* as a connecting factor in the context of the transfer of intangibles on a distributed system. These paragraphs also observe, however, that where DLT arrangements merely record transfers of immovable property, it seems unlikely that a court will apply any law other than *lex situs* of the underlying asset. And where the system is set up to record transfers of moveable, tangible assets, the *lex situs* approach would also reflect a conflicts of law rule which is, today, (almost) universally adopted for that purpose. As such, while the application of *lex situs* will be inappropriate in the case of many of DLT transactions—particularly in respect of virtual assets—there may be specific contexts in which it could be considered germane. Another way to look at this distinction is to observe that DLT arrangements can be dispositive of title or merely a means of keeping

²⁶ On such principles see Dicey & Morris, §1295.

records. Where the arrangements are not dispositive, but rather reflective, of title in the “real world”, proprietary questions will be governed by the traditional conflicts of laws rules that apply to property, including the *lex situs*.

Elective Situs

- 6.4. The PRIMA principle, highlighted at paragraph 4.5 above, was not ultimately incorporated in the Hague Securities Convention. Instead, a revised or adjusted PRIMA principle, termed PRIMA+, was adopted, which abandons the idea of attributing a location to book-entry instruments and replaces it with an approach giving effect to an express agreement on governing law between an account holder and an intermediary, subject to certain limiting requirements (e.g. the “**Qualifying Office**” requirement that the choice of governing law must favour a jurisdiction in which the relevant intermediary has a qualifying office).²⁷
- 6.5. Extrapolating this approach and applying it in a DLT context, one possible solution could be that the proprietary effects of transactions on a DLT arrangement should be governed by the system of law chosen by the network participants for the DLT system. This approach is sometimes referred to as “elective *situs*” to preserve an analogy with the *lex situs* conflicts rule. Participants in the DLT system would be able, on this approach, contractually to choose the law governing ownership, transfer and use of assets.
- 6.6. One advantage of an elective *situs* approach is that the proprietary effects of all transactions on the system would be subject to the same governing law. Furthermore, the applicable law of the transaction is fully transparent to participants and can be accurately reported for regulatory reasons, without the need for detailed supporting legal opinions.
- 6.7. Two threshold issues which would need to be considered and resolved with respect to this approach are that party autonomy is not universally accepted as a choice-of-law principle for proprietary issues,²⁸ which may constitute a bar to the adoption of a single rule among different jurisdictions, and that it may be more difficult to apply the rule in respect of permissionless systems. In the case of permissioned systems, however,

²⁷ See Article 4 Hague Securities Convention, available at <https://assets.hcch.net/docs/3afb8418-7eb7-4a0c-af85-c4f35995bb8a.pdf>.

²⁸ See Takahashi *supra* n.9 at page 17.

acceptance of a particular governing law could be included in the terms for accession to the system (as is currently the case with, for example, clearing houses).

- 6.8. A more significant issue is likely to be the perceived regulatory risks in allowing an unfettered choice of law by the system's participants. One of those perceived risks is likely to be the possibility—albeit remote—that the participants will chose a system of law which is unrelated to the assets and subject to significant undue external or private influence. This could ultimately facilitate the mass transfer of assets in the system by means of a legal adaption (most likely, new legislation) in the jurisdiction identified by the connecting factor. These risks will be understood to be more acute in cases where the participants in the system are intermediaries acting on behalf of clients.

Modified Elective Situs

- 6.9. To meet this problem, participants' choice of *situs* could, in theory, be restricted in a variety of ways by regulation and/or by technology, creating the opportunity for a modified elective *situs* rule. For example, election could be limited to a choice of law approved by regulators, or restricted in respect of a choice of law lacking any connection to the DLT enterprise.²⁹ Regulators may consider this necessary if they perceive that the uninhibited choice of the parties might be used for avoidance purposes, or that such free choice could run counter to public policy.
- 6.10. The Rome I Regulation provides a precedent, in an E.U. context, for restrictions on party autonomy as regards choice of law, both in the case of consumer contracts and to preserve the effect of certain overriding mandatory provisions of national or European law.³⁰ It does not, however, restrict the options available to the parties in respect of the express choice of law but rather preserves certain protective rules notwithstanding that express choice. A rule requiring approval by one or more regulators would face the difficult but not insuperable challenge inherent in identifying the competent authority or authorities for a distributed system.

²⁹ On such possible restrictions, see Paech, "Integrating global Blockchain securities settlement with law and regulation—Policy considerations and international principles" (August 2016) at p.7, available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2792639.

³⁰ See Article 6, (which is subject to an exemption for financial instruments at Article 6(4)(d)) and Article 9 (on overriding mandatory provisions), respectively. Overriding mandatory provisions are provisions respect for which is regarded as crucial by a country for safeguarding its public interests, such as its political, social or economic organisation, to such an extent that they are applicable to any situation falling within their scope, irrespective of the law otherwise applicable to the contract under Rome I Regulation.

Deemed Election

- 6.11. An alternative solution is another variant of elective *situs*, which looks to deemed election determined by the relevant primary regulatory or competent authority, where applicable. Advantages of such an approach include that the proprietary effects of all transactions are subject to the same governing law, and that this governing law would be transparent to third parties, on the (likely) assumption that such deemed election would be public knowledge. The question of specifically how—and on what basis—a given DLT system would come under the purview of a particular national regulatory or competent authority, however, provides a significant obstacle to the efficacy of this solution.

Chosen law of the transaction / transfer / assignment

- 6.12. Legal questions about entitlements to property chiefly arise in the context of one or more transfers of an asset. In the case of DLT arrangements these transfers are the transactions recorded in the ledger. Two choice of law rules for transfers of intangible assets in the form of claims (i.e., broadly, *choses in action*) can be found in Article 14—*voluntary assignment and contractual subrogation*—of Rome I Regulation. Of these two rules, one deals with questions arising between assignor and assignee (which are allocated to the applicable law of the assignment) and one deals with questions about the assignability of the claim and its enforcement to the “law governing the assigned claim”. Neither rule, however, expressly deals with the kind of proprietary issues which can arise in relation to third parties, e.g. *vis-à-vis* an assignee of the claim whose title or interest is in doubt or in competition with another entitlement.
- 6.13. In a recent *Consultation Document on conflict of laws rules for third party effects of transactions in securities and claims* (the “**Article 14 Consultation**”), the European Commission proposed to close this gap and asked consultees to consider three choice of law rules for the proprietary effects of an assignment of a claim or claims.³¹ The first of these is the applicable law of the assignment.
- 6.14. The virtue of applying the law of the assignment (i.e. transaction, which in Rome I may be an outright transfer of the claim or an assignment by way of security interest) to determine the proprietary effects of the transaction is chiefly that it allows the parties to the transaction to choose the law which will govern its proprietary effects.

³¹ Available at: https://ec.europa.eu/info/finance-consultations-2017-securities-and-claims_en. This consultation has since given rise to a Proposal for a Regulation on the law applicable to the third-party effects of assignments of claims, available at: https://ec.europa.eu/info/law/better-regulation/initiative/184489/attachment/090166e5b927bdfb_en.

- 6.15. Other advantages are said to be simplicity and coherence with the choice of law rule on contractual effects. One significant disadvantage, however, is that the rule offers no answer to the problem of competing entitlements in some cases where successive transfers take place under different governing laws. It also requires participants within a DLT system, who are party to a transaction, to co-ordinate and agree which law should govern the proprietary effects of the transaction. Such a requirement introduces practical difficulties and inefficiency to a technology that is otherwise intended to improve the speed and efficiency with which transactions can be concluded. Finally, it will lead to fragmentation within a given DLT system, with the transactions recorded thereupon being subject to multiple different laws.

Place of the Relevant Administrator/Operating Authority/Private Encryption Master key-holder (PROPA/PREMA)

- 6.16. This proposed solution looks to the place of the relevant administrator or operating authority (in either case, the “**R(O)A**”) which approach could be termed “**PROPA**” (Place of the Relevant OPerating Authority/Administrator). This approach presupposes that a DLT system in a financial markets context should necessarily be both: (i) permissioned and (ii) not decentralised, and under the control of a central operating authority or administrator (i.e. one which performs core functions, acts as a point of contact for regulators and provides a gatekeeper function).
- 6.17. The governing law in such a DLT system would either be that of the location of the R(O)A, or alternatively the R(O)A could be responsible for determining the governing law. While neat, and providing a high level of immediate certainty, this solution could present problems if the R(O)A needs to move jurisdiction (in, for example, a Brexit-type scenario). Moreover, in some cases it may not be entirely clear who the R(O)A is, and this could give rise to significant complications. For example, it is possible that there will be some administrators whose role is limited to the verification of the identity of participants (in order to enforce anti-money laundering policies) and/or the provision of technical access to the ledger. Is such an administrator an R(O)A? As a further example, there could be two candidates for the R(O)A title located in different jurisdictions with equivalent powers, generating a need for additional rules in order to enable a choice between the two.
- 6.18. A very similar approach would look to the location of the private master key for the DLT system (for those systems where such a key exists), i.e. the key by which the R(O)A or other related DLT enterprise ultimately controls the ability to transfer a

digital asset. This location would presumptively be the primary residence, centre of main interests or, possibly, domicile, of the master key-holder. An approach which reflected and crystallised this presumption could thus be termed “**PREMA**”—referring questions to the law of the Primary Residence of the Encryption Private MAster key-holder. A significant disadvantage which this approach would have to resolve would be the increasing prevalence of tertiary “warrant” keys—in addition to encryption master and user keys—which allow DLT enterprises to decrypt data if they are served with a court order.

- 6.19. The FMLC is informed by stakeholders that, in respect of both of these approaches, establishing the location of a person (such as the R(O)A, or a master key holder) will necessitate complex legal opinions, thereby increasing costs for market participants.

Location of the Issuer Master Account

- 6.20. An analogous approach would look to the location of the issuer master account in relation to securities issues where there is no intermediary and investors hold securities directly from the issuing company (and where, most likely, each issue would be based on its own blockchain). Many of the advantages and disadvantages are the same as those outlined immediately above. An additional advantage is likely to be alignment between the choice of law and the legal system under which claims must be ultimately be enforced against the issuer. A further disadvantage is a lack of alignment between the choice of law and the legal system under which regulatory or legal action against the system administrator can be taken most effectively.

Location of the Participant/ Transferor/ (User) Private Encryption Key

- 6.21. A wholly different approach would apply the law of the place where the system participant who is transferring the assets is resident, has its centre of main interests or is domiciled.
- 6.22. This approach flows from another rule put forward by the European Commission in its Article 14 Consultation, further to the chosen law of the transaction/transfer/assignment referenced above; the rule that the third party effectiveness of an assignment of an asset should be governed by the law of the assignor’s habitual residence.³² In a DLT arrangement, this person would be the transferor of the asset subject to the transaction recorded in the distributed ledger. The main advantage of the rule is said to be that it is particularly appropriate for the

³² This is the rule now incorporated by the European Commission in its Proposal for a Regulation on the law applicable to the third-party effects of assignments of claims, *ibid*.

transfer of assets in bulk, because it avoids the problem which would otherwise be posed for transferees of having to conduct due diligence on each asset under its own governing law or *lex situs*. The relevance of this benefit in a DLT environment is, however, questionable. A major disadvantage of this rule, moreover, is that it will often give no clear answer to questions of entitlement in circumstances of joint transferors, chains of assignments, or a change in habitual residence by the transferor. It also artificially splits up the distributed ledger record.

- 6.23. A very similar approach would look to the location of the private user key for the DLT system, i.e. the key by which a participant in the system controls the digital asset. This location would presumptively be the primary residence, centre of main interests or, possibly, domicile, of the user key-holder. It may, however, be difficult to objectively determine the location of the private user key, particularly as one key may be made up of several components held across multiple jurisdictions.
- 6.24. Furthermore, and as flagged at paragraph 6.19 above, establishing the location of the relevant person in the case of both of these solutions will necessitate complex legal opinions (and cost).

Law of the assigned claim

- 6.25. The final rule in the Article 14 Consultation is that the proprietary effects of a transaction should be governed by the applicable law of the assigned claim. Occasionally, this is understood to be a kind of *situs* rule for intangible assets, where the *situs* is deemed to be in the place connected to the legal system identified as the applicable law of the asset. More often it is understood to be a *sui generis* conflicts of law rule.
- 6.26. Where a DLT system is used to record transfers of assets which comprise a credit claim against an issuer established independently of the system, this approach would not only have many of the advantages of elective *situs* (but where the election is made by the parties to the claim, rather than participants in the system), it would also have the advantage, in the E.U. at least, of aligning with the wider conflicts of law regime.
- 6.27. This option can only be implemented in respect of intangible assets which have a separate existence from the DLT system (i.e. not tangible assets or virtual tokens). Logically, the proprietary effects of the residue of transactions would be left to the *lex situs*, in the case of intangible assets, and to a rule tailor-made for a distributed system, in the case of virtual tokens.

Lex Codicis

- 6.28. This final possible solution looks to the governing law of the code that was used to create the original distributed ledger programme. This is usually taken to be the primary residence of the original coder. This could be referred to as the *Lex Codicis* or *Lex Digitalis*,³³ or, more accurately, “**PResC**” (Primary Residence of the Coder). A significant disadvantage of this solution is that it is difficult to explain why the original coder should impact the ongoing life of the distributed ledger where s/he is not also the system administrator.

7. THE FMLC’S PROPOSED SOLUTION

- 7.1. This canter through potential solutions makes it clear that no one solution can fit all possible DLT systems. The appropriate connecting factor may vary depending on the type of DLT system (for instance, whether it has an R(O)A at its centre or if it is fully decentralised) or on the nature of the assets that are circulated on the ledger (for instance, whether there are off-platform tokens referencing an immovable asset, or a cryptocurrency like Bitcoin). It may also be that, as the technology develops and evolves, so too does the appropriate solution.
- 7.2. Yet in order to avoid the negative consequences that stem from the status quo, beset as it is with legal uncertainty, it is necessary to create a framework within which the governing law of the proprietary effects of transactions on a DLT system can be determined. This need is particularly pressing in the case of assets which have no existence which is independent of the DLT system (the greater part of which can be covered by the soubriquet “virtual tokens”).
- 7.3. It is the view of the FMLC that elective *situs* should be the starting point for any analysis of a conflicts of law approach to virtual tokens. This solution meets the requirements of being objective and easily ascertainable by the parties themselves and provides the clearest route for establishing the governing law within the context of this new technology.

³³

Computer code itself, of course, cannot be said have a particular *locus*. With the advent of smart contracts, certain providers were keen to proliferate the view, encapsulated in the expression “the code is the contract”, that automated decision-making on a DLT system had excluded the possibility of legal ambiguity and thereby “done away with” the need for legal advice as to contractual or proprietary rights. The FMLC does not share this view. The point is discussed in a whitepaper published jointly by ISDA and Linklaters, available at: <https://www.isda.org/a/gsiDE/smart-contracts-whitepaper-press-release-final1.pdf>.

- 7.4. Objections to this solution may be raised in relation to the risks perceived in allowing an unfettered choice of law by the system’s participants. One of those risks is likely to be the possibility—albeit remote—that the participants will chose a system of law which is subject to significant undue external or private influence. It may be said that this could ultimately facilitate the mass transfer of assets in the system by means of a legal adaption (most likely, new legislation) in the jurisdiction identified by the connecting factor. These risks will be understood to be most acute, however, either in cases where the participants in the system are intermediaries acting on behalf of clients; and/or where the assets being transferred on the system are “real world” assets located in a different legal system than the one chosen by the participants.
- 7.5. In situations where a truly elective *situs* or governing law (in the sense of a free choice) cannot readily or sensibly be implemented, the PROPA approach or the location of the user test might be thought to reflect a more desirable result. The desired outcome, however, can be usually be realised in such cases by requiring regulated entities to agree upon a particular choice of law in their contracts—that is provided that the issuer (in cases where the system constitutes the assets), the system administrator and the participants are regulated under new or existing legislation. In other words, the correct substantive result can still be achieved by means of election, but the election itself may be subject to regulatory constraints.
- 7.6. On a point of caution, however, the FMLC notes that the current model of regulation may evolve as new technologies galvanise changes to the framework of the financial markets. FMLC stakeholders with expertise in technology have expressed the belief that the greatest future advances within the DLT sphere will be delivered via permissionless, fully decentralised DLT systems with no R(O)A. In such a future, connecting factors which do not depend on centralised coordination, such as the chosen law of the transaction/transfer/assignment and the location of the participant/transferor will be of increased relevance (even if encumbered by practical difficulties, as discussed above).
- 7.7. In summary, the FMLC adopts the view that a governing law can be selected for most of the DLT systems being designed and built today and that this particular approach, coupled with intelligent regulation, leads to the most efficient and clear way of arriving at a solution to this issue of legal uncertainty.
- 7.8. Finally, the FMLC also proposes that where the asset has an existence which is wholly independent of the system—such that the system serves purely as a means of recording

the transaction and neither title nor the asset is constituted thereby—the proprietary effects of the transaction should be determined according to the conflicts of rules which would ordinarily apply outside the system. In the case of transfers of immovable assets, in particular, it is almost inconceivable that a court would apply a different rule, in any case.

8. CONCLUSION

- 8.1. This paper has identified a number of possible connecting factors to be used when identifying the governing law for the proprietary effects of transactions conducted on a DLT system. It has concluded that—subject to a special rule in respect of tokens referencing an immovable asset—elective *situs* should be the first port of call, in combination with regulatory constraints on the election, where necessary. The FMLC further recommends that any solution is promulgated by a body such as the Hague Convention, UNIDROIT or ISDA, in order to ensure that it is adhered to on an international basis.

Appendix A

1. Additional issues of legal uncertainty:

- a) where property rights to an asset are transferred or “converted” onto a distributed ledger (rather than originating within the distributed ledger system), are these rights replaced by new digital rights, or will there be multiple sets of rights acting in parallel?
- b) might this answer alter depending on the jurisdiction, leading to the conclusion that where a real world asset is “converted” (so that it is represented on a DLT system) the law applicable to such a conversion will be of vital importance?
- c) does the nature of an asset change when represented on a DLT system?
- d) does the exact nature of participants’ rights on a system change where there is a real world asset involved?
- e) which law determines whether a system can be characterised as permissioned or permissionless? And whether a ledger is a record ledger or a title ledger? Is it possible that these questions can be judged on the facts?
- f) will alternative legal remedies be needed to address circumstances where the valid award of a court applying the elective governing law of a DLT system, e.g. to restore a proprietary interest, is incapable of enforcement because relevant nodes controlling the ledger operate outside the jurisdiction of that court.
